THE ONTOLOGY OF THE EARTHEN MIND AND HUMANNESS

Krylov, Vladimir

The Ontology of the Earthen Mind and Humanness / Krylov, Vladimir Petrovich. – Minsk: UP “Tipografiya FPB” 2018, 94 pp.

Concepts about our human essence including mind and thinking have been described, which can be appraised differently based on materialistic or idealistic approaches to address human existence. Whatever the viewpoints are, our core is still the same. Misunderstanding of the human structure and intercalating it to the rest of the animal world may lead to many mistakes in life and loss of one’s own future.

The present scientific, materialistic and idealistic work has been built on the analysis of different materialistic and spiritual sources, logic and probably some ‘extraneous’ help. It was meant to give the earthy human the clues to our Universe and our planet, the true structure of homo sapiens sapiens and their goals and mission here on earth. These fundamentals can be of great help on our earthy journey and may help to get through it with fewer mistakes and losses.

The work bears some insights on the future of our civilization.

*As the Eastern wisdom goes:
if you are for no one, what are you for?*

PREAMBLE

The ever-growing misbalance of global natural and social processes makes many think about the reasons and consequences thereof. However, this turned out to be a hard nut to crack for current generations because over the last several decades, the society has been losing its human values, and social structures, countries, nations and interpersonal relationships becoming progressively disassociated. These factors have made kind and pure human relationships less attractive; the concepts of honor, conscience, compassion and other virtues have come dominated by selfishness, overindulgence and temptations.

These changes are apparent in countries with high level of consumption. In 1978, in his “A World Split Apart” address to the audience of Harvard, Aleksandr Solzhenitsyn noted that the countries with their “own established freedom” became obsessively preoccupied with buying material goods which started to be given more value than everything else. The originator of this “freedom” was a human being with no restraining power over them. The author speaks about “a moral poverty» resulted from an unsuccessful searching for meaning.

More than 40 years ago, he prophetically stated that if «God is displaced by humanism», the absence of actual responsibility for one’s own actions will lay a groundwork for any crackpot idea that the human brain may encounter. The meaning of this declared ‘freedom’ has become so strong, that this concept has

also become relevant for religious institutions. Churches and synagogues have been reducing their religious activity primarily focused on the formation of ‘favorable’ social environments.

This shift of interests observed among the clergy has actually been more dictated by downgraded religious activity shown by the population, which has come more focused on quick and comfortable satisfaction of their wants and needs in the context of technological success facilitating consumption and material security.

At the same time, populations of poor countries, where glut, selfishness and consumerism are not as widespread, are first to be considered ‘believers in God’. Therefore, the Roman church and some Protestant churches lacked in regulars are becoming ever more focused on those countries. Moreover, the same situation is observed in Asian Orthodox congregations despite the fact that the attendance in Orthodox cathedrals and mosques has always been excellent, and it allows to proliferate even more congregations. Southeast Asian countries including the Philippines, Indonesia, Vietnam, Malaysia, Singapore, Thailand, Cambodia and Taiwan are more promising than ever before for Missionaries of the Russian Orthodox Church, and increasingly more Moscow Patriarchate cathedrals have recently arisen.

The question is: What are the rich, educated and financially secure going to replace the religion with? Will they morph into some new, top-grade people compared to other earthlings including those who are religious?

These questions can be answered if we refer to the essence of our life and tell who we are and why we live. Neither materialistic, nor religious science can give us any insight into those issues, however, both deal with them to some extent. Esoteric schools

unveil the subject a bit but gives no specifics about the mechanism of human experience of living the earthy life.

It does not seem unreasonable that the disclosure of those mechanisms breaks God's taboo on the mystery of human development, which is to be comprehended individually. At the same time, we can see people sliding down to a body indulgence pattern forgetting about the moral stand, which distinguishes Man from the rest of the animal kingdom.

The aim of the present work was to specify mechanisms and ways to keep us on track and maintain 'humaneness' that saves us from being lost in the sea of temptations and appeal.

The book does not fall into a category of easy, 'popular' reading because the issues presented herein are not broadly discussed. It is contradictory to scientism (or scientific materialism) and commonly accepted life principles. Concepts about human essence, mind and cognition mentioned hereunder lie between materialistic and idealistic concepts of human existence.

This materialistic idealistic work has been produced based on the analysis of different sources including materialistic and spiritual, as well 'a little bit of' logical reasoning and probably some 'extraneous' help! It can draw us near to understanding of the Universe and our planet, as well as the true structure of *Homo sapiens sapiens*, its aims and tasks on Earth. Knowing the basics, we can go all the way through the earthen sojourn making fewer mistakes and experiencing fewer losses. The author offers his view of the prospects of our civilization.

The book is not simple because everything we know about this world and our place in it are largely wrong; but if the reader can grasp the essence of two schemes presented in the book, the material aspect will be easier to understand.

CHAPTER 1.

EARTHEN MIND

The notion of the earthen mind has always been an issue for people. A whole lot of works, sometimes contradictory, has been published about its origin and location. Yet, investigators of this phenomenon typically relate it with the human brain because they consider their body the owner and keeper of Self. This judgment owes its existence to the materialist conception of the world and technologically evolving communities in it, as well as wrong understanding of the human essence told by major religions.

It might be that a more distinct information about the human essence and origins of the earthen mind was not planned to be divulged to humans for their own sake, not to deprive them of their God-given free will. No doubt that our ignorance of the universal immutable laws will push us into making much more mistakes. More preferred is trial-and-error progressive maturation of human race, which is what we've been doing for many thousands of years.

The current state of affairs in the people's community suggests that it's become unfit for living within moral standards because conventional human laws and regulations (we call them 'moral responsibilities') are no longer executed. It is particularly disastrous on the international arena. Petty tyrants and 'law-unto-themselves' covered by fake diplomacy have become omnipresent. A family institution and family values have been overtly ignored widely replaced by perversions, corruption, social and mental degradation.

Being a norm for today's life, this global selfishness with its lust, uncontrolled consumption and greed has begun to become an unbearable burden for our planet to carry. Its sufferings are appalling, and one wonders how long it will stick? At the same time, we are developing a 'first strike' concept to outplay the rival although it is as clear as day that there will be no victors in the nuclear war and the civilization will be lost forever. There are enough of schizos out there ready to press the 'atomic charge' knob, especially in the light of a gradually diminishing human mind.

Perhaps, it's high time to talk about things we've been steadily losing as the mind is a cornerstone of our personality without which a human being is not more than an animal. Hopefully, comprehension of this will help someone wake up, wise up and opt for a correct decision for oneself and society. No time to lose because it may never be more time for our civilization.

1.1. Where Does the Mind Come From?

Knowledge is the source of the mind. Efficient management of knowledge is a key factor of a potent mind. Knowledge is primary, therefore reduced knowledge makes reduced mind.

However, a full implementation of the mind requires a social need therein as well as circumstances for keeping available knowledge secure. Thus, a lack of integrated infrastructure in the society is associated with the reduced mind due to it being partially unwanted. Our civilization has repeated this scenario more than once, and it would come alive again each time after a global natural or technological disaster occurred, and a new era of gaining and accumulating knowledge recovered.

How do we acquire knowledge? The experience we accumulate through trial and error seems able to improve our cognition. It's okay with this way despite being rather slow and efficient at the early stages of civilization development or revival. However, the development of culture prompts one to comprehend society and the ways to change it to be consistent with one's own needs and interests. That needs breakthrough ideas and inventions, and they may come as if from nowhere.

The Greeks, for instance, burnt down the enemy's fleet, which would be later called 'Greek fire'. Its prototype had appeared circa 190 B.C. while protecting the island of Rhodes. Then it would be again 'discovered' in the year of 673 by Callinicus, an engineer and architect, who volunteered his services to Emperor Constantine IV to battle Arabs.

Leonardo da Vinci, born in 1452, amazed people with his designs of flying machines, presses, sluice gates, canal locks, and mills that looked absurd in those days. Those inventions scared the public that thought him to be a sorcerer who'd made a deal with the devil. Archimedes, Jules Verne, Alexander Belyaev, Wernher von Braun, Andrey Sakharov and many others were all prescient geniuses! Where would these people got their knowledge? Hard to answer. Two variants can be

proposed. First, knowledge might have been acquired from the previous civilization. There are many examples to it. The most persuasive ones include the geographical maps made by Piri Reis, Buache, Oronce Finé, Mercator, Ptolemy and others. Despite being referred to the mid second millennium A.D., they can boast of being more accurate compared to present-day maps. A high-altitude photographic surveying considering sphericity of the Earth is required for those maps to be produced, which was absolutely out of the question in those days. What seems even more striking is that those maps show the ice-glazed (as well as ice-free) Antarctica adjoined and disjoined by South America, while other maps (by Piri Reis) show no Bering Strait. It suggests that the efficient mapmaking had been practiced thousands and thousands of years ago registering geological changes for quite a while. We have no clue how those maps might have been preserved and survived to the present days.

The ‘creatures-from-outer-space’ thing doesn’t count as it can be only presumed with some detailing of what those creatures really are and which will be detailed further on. We are helpless with lots of artefacts we’ve inherited because we are clueless about the substance. We can’t build neither devices mentioned in the Vedas, nor Noah’s ark, nor the Ark of the Testimony. Lack of mind?

Here we have scenario 2 of getting knowledge, which is fundamental for the development of an individual. In any civilization, there live those we call ‘the mind frontliners’ followed by a mainstream society who ‘compile’ their best practices. No doubt, compiling ideas and putting them into practice require a developed mind but It’s still inferior to the mind of the ‘frontliners’. They constitute Level 2 of the society.

However, there is a share of people who take no interest in either personal, or societal development. Most of them are just consumers.

This entails technical, societal and moral education of an individual. Once one reaches a certain level of expertise in any field keeping on searching for a solution to a problem of interest, they will by all means be offered new fragments or guides for further research. Or else, one may discover the much needed information in the most unlikely place you'd previously walked by. Or you may see your yearned-for thing in your dream while snoozing. The periodic table by Mendeleev is a good example. It was given to the author while sleeping. Although it seems like mystic, but this mechanism is inherent to the mind to be developing, and 'an option' for the humankind to get help from people more forward-minded who come the closest to the problem they are seeking a solution to. Everything that happens to us is subject to specific laws shaping us as individuals who are expected to be always yearning for knowledge and truth, and not necessarily have a '1 million dollar' mind.

Continuous accumulation of knowledge and expertise on the border with the unknown improves the reason allowing moving on to a higher level of the Universal information field further upgrading the individual.

Stereotyped images we've been holding onto about our life should be left behind as it is much more intricate and complicated. Materialism restricts it to the body while major religions on serving the Lord. However, a structure of the earthen human, their destiny and functions are not fully fit into these conventional views. There is another worldview, not contradictory to a current life and still much wider and substantiated.

Unfortunately, the reality is that we can perceive things inasmuch as our experience and sense organs permit us to. Additionally, we need tools to understand objects including logic analysis of the incoming information with forecasting of possible scenarios, and abstract thinking. It's not so bad in the context of the earthy living. Therefore, it's high time to make active use of opportunities to improve our cognition for further evolution because all the other things, more accurate and sublime, will be learnt beyond the earthy life.

Piece by piece shall we put together all the things we know about the Universe and the human being in it, as well as the role the human race plays in the developments. Otherwise, the picture of our world will remain vague and blur. Transmundane worlds are wider and diverse compared to ours but each of us start building their future 'home' here on Earth.

1.2. The World Order

Ideas about the Earth and the Universe differ based on either views assumed by materialists or those accepted by theists believing in a higher power. The former observe and experience the material Universe while the latter believe in the Kingdom come and praise the Lord, and still others, non-materialists, worship lords of the elements, spirits, demons etc. using different methods to contact them. As seen, a spectrum of cognition of the environment is quite broad, has its own specific characteristics, experience, and associated insights, which can't be ignored because we practically have no other reliable sources. Even the evidence-based high-tech science has been treading water for quite a while producing no cutting-edge breakthrough products improving the same old, same old instead.

Materialists view the human being as a personality and cognition being clueless about what to do with them. They try to find the core of things, carefully scrutinizing biological tissues to identify a ‘primordial brick’ underlying the structure of the Universe although they are well aware they can’t fully grasp the material through their prism because no structure is able to comprehend hidden mechanisms of its own birth. Otherwise, everything could produce itself on its own, which is impossible because we must know where, what for and how we may take that brick and put it in place. It takes some extraneous interference, too. Denying this, the attitudes expressed by materialists will by all means be flawed and contribute to a degradation or death because they deprive themselves of an alternative concept of another life advocated by religions, epics and ancient written records.

The world order has been described in full measure, and they are trying to get to the core of the matter based on the principles they believe in. Materialists are focused on the structure of the Universe including the nature of Earth and Man. Eastern systems of belief see it larger; they practice communication with lords of the elements piercing through the adjacent worlds close to ours. Psychics, shamans and sorcerers are especially successful in it. Major religions suggest the more global and monumental world order while the esoteric science tries to strip away a mystic veneer in the assessment of the actual reality.

Thus, the information is sufficient for summarizing all data about the current state of affairs and make things as clear as a bell. As a result, we get a coherent picture of the world order. Of course, we can’t experience all subtleties being in the realm of the material life, but It’s crucial for us to understand the

principle thereof as this knowledge are a lifebuoy in the sea of selfishness, lack of morals, omnipresent consumerism, lying and accelerated degradation luring the ever new social strata.

1.3. The Universe, a Home We Share

The Earth and the Universe are just a minute share our common home available for various forms of life. ***It is a structural and functional form of existence of the same energy, which creates worlds containing different strata of basic energies that unite spaces of different dimensions and allow, if necessary, their juxtaposition in metric frames without mutual interference.***

Thus, our Universe stems from the same energy, the energy of the ‘beginning’. The New Testament, the Gospel according to John says: 1. In the beginning was the Word, and the Word was with God, and the Word was God 3. All things were made by him, and without him was not anything made that was made.

This initial energy belongs to God, and it can’t be quintessentially perceived by anyone or anything living in the Universe, because it is far beyond their possibilities. This is a sizzling energy of the Light compared to which the sunshine looks like gloom. Using its energetic material, it made up the divine realm with *its inhabitants* responsible for different principles in the Universe, e.g. male and female, which include archangels, warriors and those who we can’t even classify, but fulfill tasks involving building and functioning of the periphery.

From the energy of the divine realm, the spiritual realm was born consequently having less of that energy potential (Fig.1). Both of these realms produce the Primary Creation, which was probably created once and for all. It’s immutable, although there is a lot of activity going on in there!

Figure 1

Despite the seeming self-sufficiency, the Primary creation still has to occasionally create the Secondary creation for some purpose. The secret lies in the spiritual realm. It turns out that the realm is inhabited by *primary spirits* of the divine realm while the periphery is inhabited by *highly-developed* Spirits. They might be called ‘aliens’ because they came from the Secondary creation, but it would be wrong considering their essence originates from the spiritual nature and they had been within the spiritual realm before the Secondary creation was established (Fig. 2).

CREATOR

Primary Creation	Divine Realm Managers of all principles of the Universe Archangels
	Spiritual Realm Primary Highly-developed
Secondary Creation	Essential Realm Energy strata: ultramundane (omniscience and cognizance) Abstract thinking Analytical thinking Logical thinking Astral energy (emotional perception and thinking)
	Material Realm Ethereal energy Ethereal energy of material bodies (perceptions by sense organs and reflection)

Figure 1

The Secondary creation and the visible Universe fold and unfold (i.e. disappears as a functional unit) with the same frequency with the same intervals of several trillion years. It has two realms including Essential (i.e. where energy beings with Self are formed) and objective realm full of material objects and material beings (humans included).

The Essential realm fills up the Secondary creation while herein lies the objective realm as fragmentized (broken) segments attached to the material planets scattered across the Universe

where, if well matured (provided certain conditions), they form various forms of life, consciousness included. Thus, islands of the material world are careering through the Essential realm as fragments of the objective realm.

Figures 1 and 2 show schemes of the Universe with the Secondary creation being unfold, i.e. in its present state. We, the living on Earth, are interested in this particular state of the Universe, as we are the key figures influencing changes happening in it within this precise moment. We should know to prevent ourselves from making tragic mistakes and complete our training successfully having preserved our Self.

Epic and religions somewhat disclose the structure and functions of the Secondary creation's invisible part. They say that the **highly developed** spirits of the Primary creation are formed within the Secondary creation from the spiritual seeds of the Primary creation 'planted' into the objective realm. To fulfill the assigned task, the seeds, under the supervision of fairies are to come down to earth and put on the sheaths (as armors), subsequently connecting with the material body (see Figure 2). In the course of several lives, they must perceive all variants of living within their materials bodies and go back afterwards stripping off their energy sheaths of the Secondary creation. Therefore, the **highly developed** spirits, free from their sheaths, come back home to the Primary creation as 'having been through it all', i.e. the Secondary creation professionals.

So, the Secondary creation has been currently unfold, and we are co-existing with the visible Universe where material objects, surrounded by an invisible subtle and raw ethereal energy of the Objected realm, are speeding along the Objected realm following the laws of the Universe. *Ability of superior strata*

energies to produce inferior strata and pervade them without combining with them preserving its shape and functions is one of features of the Universe. A coarser energy won't ever be able to penetrate a subtler energy, therefore our body can't even reach the subtle ethereal stratum. The spirit, however, can do it by getting rid of the material body, a raw sheath for the spirit.

The question then arises as to how all that concerns us? The answer is: directly. We ARE those pieces of spiritual energies originated from the spiritual realm sent inside the Secondary creation to undergo training and to know how it functions; accumulate experience and get clean from crude layers of energy separating the quintessence of love and more from astral energy. To excel at it, free will has been granted to us. We may get carried away by seducements from any level of the Second creation and end up there when it is folded. However, if we withstand the training, we can return to the spiritual realm as ***highly developed Spirits with the Self***. Therefore, major religions tell about the eternal life of man while burying or burning the body without explaining why because of the fear of ruining canons or they just don't know what to say about it.

We are living right on the periphery of the Secondary creation of the objective realm and qualifying ourselves for being the ***highly developed Spirits***, which is our intent. There is no guarantee, however, that this challenge will be met. Various sources say that this road is narrow and very hard to travel let alone understand.

The Essential realm nurtures beings from spiritual seeds that then become conscious individuals with the Self. In return, the objective realm allows those individuals to experience life and develop skills to manage knowledge they wish to master.

In all its seeming infinity, the Universe is just a tiny portion of the creation. Therefore, there are no nomadic planets in it with all of them undergoing stages including formation, bloom and degradation. This process is seen on other planets as well. Some legends say that the number of individual ‘plantings’ of Spiritual seeds solely for our planet has been about 15 billion, as mentioned in some legends. Considering the astronomical number of Secondary creation duration (about several trillions years), there must be quite a few ‘plantings’ therein.

All realms of the Creation are consisted of multi-layered energies, although all of them have been derived from the ‘WORD’. The further the energy is from the Divine realm, the cruder it becomes and more specific to fulfill tasks of a specific level. It gets modified into a social and ecological energy of each realm, and a variety of other energies, which obviously provide conditions for a fulfilling life. Moreover, there is a specific sort of energy that can be determined as a level-sensitive information field, a database of knowledge or cognition.

There is not much difference for an earthling what is happening in the Divine realm and in the spiritual realm where *primary* Spirits dwell. In contrast, what is more important for us is what happens to us on our way from the spiritual realm to the Earth and back as it defines our future place in the spiritual realm or rather erase all our prospects to get there.

Our main route lies through the Essential realm heading to the objective realm, where the earthen man is created. The objective realm includes a number of sublevels. If the objective realm is counted, the first one starts from a mental energy sublevel which is divided into more sublevels including logical energy followed by analytical energy and with the abstract thinking on top of it.

A number of energies (we can call them ‘ultramundane’) are located within the objective realm near the spiritual realm, and they are the hardest thing to imagine and describe. As for the mental energies, we routinely deal with them.

Given that they are not in direct contact with the material body due to some big disparities in the levels of energy, they require a ‘balancing bridge’. This role is fulfilled by astral energy, which provides an emotional cognition of the environment. It may be observed in higher animals as a rudimentary logical thinking ability.

Moving through all these energies, the spirit is alternately ‘putting them on’ which lets it go deeper into the coarser levels. Consequently, provided with energies of knowledge and cognition, it approaches the objective realm and becomes immersed in the astral energy where souls of the higher animals, including humans are originated. It is the astral energy that links the spirit surrounded by sheaths with objective energies including the material body. It results in an *integrated human being that allows the spirit to know the material world without connecting with the body.*

Here, we’ve come to a contradiction. We see that *the objective realm with the sheathed Spirit inside is the only realm that owns energies of knowledge in the Secondary creation.* This knowledge has been born from that potent Word, which according to the Bible was ‘of God and the word was God’. Despite being the God’s creation too, this energy is absent in the objective realm, because the world doesn’t need this energy here. Energies of emotions are more than enough in order to learn the world and forge relationships with mates. It suggests

that the *material body is fully deprived of the mind, and only has an emotional cognition of the world.*

But how come everybody are convinced about the intelligent human being able to manage their knowledge? No doubt, the human body clearly has a specific construction compared to other species of the animal kingdom. Upright posture, wrists, nasopharynx, etc. allow for manipulations, both quick and simple, and conversation contacts well developed requiring mental energies, which the body doesn't contain. The problem is solved by creating an integrated human being with the spirit as a core factor.

It supervises everything - from perceptions of the environment to metabolic changes in the body. A cascade of energies affecting the brain, reflexes, genome, instincts, enzymatic and electric activities has been made available for a human to implement this. The human brain is a highly sophisticated biological computer for the spirit to fully actualize its expertise; it is a converter of cognition and speech function that regulates body functions. Functioning of the integrated human essence is impeded by the freedom of will granted to the spirit to choose priorities and actions to pursue targets. It seems particularly important our terrestrial settings, as the human body is a master of material priorities, and its sense organs may turn out to be stronger compared to experiences that have been so far accumulated by the spirit.

No matter how much resentment we have for it, the body is no more than a camouflage for the spirit and it is doomed to go back into the ground. So was the will of the Creator! The key figure here in this grandiose design is the spirit going mature. So don't be fooled by the human body that brings out emotions

of structural perfection and intellectual capabilities. All we see is just an animal, a most accomplished that features emotions, reflection and instincts like all other higher animals. No more than that! Being intelligent, cultured and socially accepted is credited to the workings of the spirit.

All that's been mentioned is not only the Earth's domain. Simultaneously, human beings sheathed in coarse and subtle ethereal energies can be found living on other planets mature enough to take Spirits. They create similar integrated human beings to educate Spirits. There is no difference between them in terms of their looks and tasks to fulfill.

Consequently, the two contradictory worlds in terms of substance, aims and tasks collide at the border of the Essential and objective realms. On the one hand, there is the spirit filled with spiritual energy and designed to complete global tasks set by the Universe; and on the other, we have the human body fronting for the material world and being alluring for the spirit. Their association as well as different aspiration vectors at the same time suggest the fundamental principle of the Universe, which is ***the Unity and Struggle of Opposites***. We have one universe and one aim, which is the education of the spirit but methods used are different in bright and dark angels, plus the body seduces the spirit using its sense organs that turn it away from good intentions.

This challenge is beneficial for the spirit. First, the spirit must come to know all the situations imaginable and get out clean; otherwise, you won't master the Secondary creation. Second, this approach will 'sieve out' lackadaisical and strayed spirits who had lost their self. But it doesn't mean much because the spirit won't have a clue what's happening to it.

We can see a fantastic mechanism of cognition of the material world by the spirit without losing touch with the Primary creation. It is due to a proximity of subtle energies to the body. Those energies of the Essential realm are peculiar for their multilayered knowledge that can reveal themselves to those ready to perceive them as a product of logical, analytical and discrete reasoning and not as a jibber-jabber. This is the Earth's information field for the Secondary creation. It is open full-time and ready to be used! This is real despite the fact that there are no such knowledge or possibilities in the objective realm and could not be as this is a habitat for the animal life with laws entirely different.

1.4. How Does the Earth Get Ready to Receive Spirits?

Everything is cyclical throughout the Creation with basic mechanisms worked out down in ages to every single detail. Unforeseen might be the results of our free will, but It's also doubtful because behavior of the masses can be now easily predicted. Therefore, the planets, earth included, which are destined to receive spirits for education, are getting ready to do it. It's obvious that there should be some beings here on earth ready to educate spirits as well as conditions sufficient for them to live.

Who are those creatures? Above all else, they must be adjusted to the living conditions to survive. They must be strong, deft, and multifunctional and have makings of developing structures and options to improve brain function and articulators.

So life begins with first protein bodies followed by protozoa, and so on, as we can see in our embryogenesis. Consequently, over several millions of years people became well- shaped,

standing on two feet, and polydactyl able to do creative work promoting improvements of brain and speech functions. At this stage, they have been called ‘new people’, the Neanderthals (*Homo neanderthalensis*). Whether the so-called archantrops (ancient people) were their ancestors hasn’t been yet fully understood, but it seems they weren’t because they’d emerged, compared to the former within a relatively short period of time over which no key shifts in cultural and social paradigms could have occurred.

It is not implausible that they might live at the same time, but then the archantrops disappeared having failed to beat the competition. It’s unlikely, that the Neanderthals are the sole immediate predecessors of Cro-Magnons (*Homo sapiens sapiens*) because the evolutionary process had evolved quite too fast! Their occurrence might be associated with extraterrestrial beings via miscegenation, or was perpetrated by a gene engineering team led by Lucifer himself. This refers to a formation of the first reasonable human. Somehow, the gene pool of this person remains between civilizations (Noah and his family were retained during the Great Flood).

There have never been any apes among our predecessors, and could’ve never been! The anthropoid apes (orangutans, chimpanzees and gorillas) that show signs of intelligence and can be taught are actually people, but degraded both mentally and physically. They must have stayed from the past civilization. When being normal people, they would neglect their Spirit and were free ‘to float’ during a global cataclysm. They were lucky enough (?) they’d stayed alive, but survival and evolution imply a strong spirit, energies of essences and efforts by angles to help to navigate our lives. In this case, survival becomes simplified,

and goes no further than just gathering typical of animals. With each generation, it resulted in a progressively deteriorating cognitive power, with the body adapting to climbing trees and inhabiting scrublands.

Individual species with a developed spirit may stay on Earth following the change of civilizations or global disasters, which become the gene pool for the civilization to come. No one else can be named ‘homo sapiens sapiens’ as they share the fate similar to that of Yeti and later of anthropoid apes. Nonetheless, even strong-spirited people can occasionally tend to some primitive behavior patterns when facing devastations or a lack of infrastructure. They confront with the challenges of survival coupled with the danger of losing their self. Right then, there appear top-ranking civilizers in all regions of the globe who teach to not eat each other, but start families, domesticate animals, use agricultural methods as well as the basics of statehood hereby levelling up the intellect to a ‘human’ rank.

We know some ancient civilizers including Viracocha, Thoth, Isis, etc. who came from nowhere and went God knows where. The last who’d completed the civilizing mission of civilizing mission was those who brought the humanity religions. They’ve defined ways to serve God and attempted to tear people off their body pragmatism. That was when the humankind had got the knowledge about the structure of the universe, human values and the threat of losing the self due to a neglected spirit. Therefore, Christian scriptures mention that after Jesus Christ, the Son of God had brought the doctrine, the Man would have to seek their own way to the spiritual growth because all forms of the existence had been presented before the eyes of man.

1.5. The human body and the part it plays in the perception of the environment

The human body has been designed to be a part of nature and operates according to its laws. Atmospheric pressure, temperature, water dissolving salts, oxygen, and other factors represent optimum natural conditions for the body to live in. Therefore, any changes Nature may undergo might result in cardinal change of life for the entire humanity. The human body belongs to nature and is an integral part of it. Ashes to ashes, dust to dust... It is the body's destiny and final destination.

The body is a most complex organism on the planet. Organs and tissues are functionally oriented and operate coherently: the heart pumps blood making it circulate through the body; the lungs turn oxygen into carbon dioxide, while the brain processes information about processes ongoing within the system and perceives the program of functioning from the spirit with its sheaths (the soul) and implements it. Other functions are responsible for locomotion and life in general.

The structure of the human body is similar to that seen in some species of higher animals. This is largely due to the fact that our bodies develop conjointly and for living in the same environment. That's why they are quite similar.

A cell represents an elementary particle of the body. A cluster of cells makes up tissues constituting the human being as a multicellular organism. A cell is intricate despite being the simplest form of life, as we know from biology.

Cells are located in an intracellular matrix, which provides nutrients facilitating respiration and mechanical strength. The nucleus and the cytoplasm are key constituents of a cell. Each cell is surrounded by a membrane with a molecule as its building

element. The membrane contains several molecular layers. It is evident that something brand new appears when the cell is formed from molecules. Moreover, the atom is not just an assembly of elementary particles as they, interconnecting, add up new properties absent in some of its components. It is the smallest part of the chemical element, which is a carrier of its characteristics while a molecule is an electrically neutral particle formed through a number of atoms linked by covalent bonds.

Although different in shape and occasionally in functions, a synthesis of proteins within them remains unaffected. The process is controlled by the genetic apparatus. The cell that doesn't synthesize proteins is actually dead. A living cell is the one having ever-changing components. All processes occurring inside the cell are mediated by the energy including nutrition, respiration, propagation and metabolism. Therefore, the living cell is characterized by a permanently flowing energy exchange. Cells constituting systems that are more complex own a clearly differentiated nucleus packed with chromosomes containing genetic material.

The human genome is the entirety of one's hereditary material contained in each cell human system. It is an aggregate of genetic material packed in a haploid set of chromosomes (23 pairs) relevant to a certain species. It includes designations concerning the body type, organ functions, and physiological changes, and preserves and reproduces these traits in the organism propagation. The human genetic apparatus is highly stable and precise facilitating required mechanisms to properly function. Nevertheless, the stability of the apparatus is not absolute, as it would exclude any possibility for change thus impeding the evolutionary transformations.

The brain is a pivotal organ of the human body coordinating the body functions in both human and animals. With regard to the human, the brain connects the spirit with the body being a transmitter and the most sophisticated biological computer. It is a mass of nervous tissue consisting of two hemirealms, two pons Varolii, and the cerebellum.

The hemirealms are required to retransmit thought processes originating from mental energy allowing a person to consciously navigate the environment ensuring speech and locomotor functions. At the back of the brain, the cerebellum is found, which helps to control balance and reflexes of the muscles. The pons Varolii are below the hindbrain, at the base of the skull. Their function includes receiving nerve impulses and sending them to or from the body.

Reflection acquired through one's sense organs is the simplest mechanism of the body to perceive the outside and the inside world. A reflex (meaning 'reflected' or 'reverted') allows the emergence, altering and termination of functional activity of organs, tissues or the entire system in response to the receptor irritation.

Reflex is an elementary unit of nervous activity. It underlies the electrical, electromagnetic and chemical nature of a phenomenon occurring in the context of a living organism's functioning with its physiological or pathological processes. Biological meaning of these reflex mechanisms includes the regulation of organ function, and coordination of organ functional teamwork to keep the body's internal environment stable, integral and able to adjust to ever-changing environmental conditions.

There is a so-called 'scientific' concept of the reflection in the previous and current materialistic theory. It gives the

reflection credit for the human ability to think critically. It advocates that this type of reflection is inherent in each person who every once in a while thinks about their own failures and drawbacks to polish up their attitudes about the world correcting mistakes to not make them in future. Several types of reflection are distinguished including elementary which represents an individual's ability to consider and analyze knowledge and actions. Moreover, they mention a scientific reflection focused on a critical study of scientific knowledge. A superior type of reflection, in their opinion, is its philosophical component due to which one can eliminate prejudices and delusions thus promoting one's spiritual growth.

“Mixing oranges and apples” – that's how the reflection, cognition and spiritual evolution are ‘interconnected’. Energies of the material world constitute reflection with electromagnetic, electric and lepton fields being the finest of them. ***Mental, analytical, let alone spiritual criteria of cognition and thinking are found in the sheaths of the spirit, not the body.*** We must realize it, otherwise, we'll have to be building our human paradise on the dying planet.

Moreover, there exists a variety of instincts and complex reflex responses to stimuli caused by specific sense organs that have been acquired during the evolutionary process. Their purpose is to preserve the body (in both humans and animals) as well as propagate through a number of sustained subconscious imperative intentions.

Laboratory investigations have also found similar imperativeness in microbes where part of the population would sacrifice themselves for the sake of survival of the entire population. It confirms that the underlying mechanism of this process ***is a***

deep-seated drive to preserve material life in the Universe at the DNA level. In organisms more complex, the intensity of instincts, i.e. their severity and quality may develop new ways of manifestation because when it comes to instincts, astral energy is predominant in the animal kingdom, ***while man is additionally dominated by mental energy.***

V. I. Gorbuzov has differentiated seven instincts including self-preservation, propagation, domination, freedom, altruism, investigation, and dignity. However, this judgment seems false because the human body as well as animal's shows two major instincts, which are self-preservation and propagation. Higher animals additionally show dominance as their basic instinct due to the present astral energy, while the other four instincts correspond to conscious (analysis-based) instincts, which are a prerogative of human beings fully matured.

Striving for knowledge and experiment is built in astral and mental energies being a prerequisite for the evolution of the human being, while free will is a primary expertise of the human because it has been granted to the spirit if it develops cognition and self-cognition as a being. Striving for dominance and dignity is based on logical self-concept promoting self-validation and search for one's own social level from the psychosocial perspective. Such is the adaptation of the human being to the realities of life. Motivation for altruism, so rare now, no longer helps to hold back selfishness of animal instincts that the human body contains within as well.

Genetic instincts can be affected though. They may be either intensified or subdued based on upbringing, stereotypic behavior, religion or morality. People, unlike animals, can assume full control over their instincts, conceal them or lift social

restrictions. They represent a powerful biological foundation that can be diminished by morality or legislation, but can never be eradicated because, in view of their crucial role, they are related with a number of hormonal, biochemical, electrical, cellular and extracellular processes without which neither body, nor spirit can function.

Propagation instincts are equally important. The association between hormonal output and sex drive is evident. Testosterone plays first violin. It is produced by ovaries (in women) and adrenal glands (in men), and this process is regulated by hypothalamus and hypophysis. That's how the human sexual behavior is formed. Whether it'll be successful or not is predisposed by both processes going on within the tissues and organs, and psychoemotional factors laid in the astral energy.

The role of instincts in human development remains significant, despite our ability to be in control and focus them by reason and spirit. It should be borne in mind that animals' survival depends strictly on their instincts, whereas our body, although highly specialized, is still just a body. We should no doubt take good care of it, but let's not go crazy about it!

*Although the bodies of higher animals and humans share similar structure and functions, they are different by virtue of their historic activities, with the human body representing a unity of spiritual, social and biological nature. **For this reason, the human body has been presented with mental structure, a more valuable and undoubtedly, more organized, which is inseparable from it without being insubordinate thereto.***

In such a way, it demonstrates its own uniqueness in the material realm built of a poor-quality material thus having no foundation for analytical perception of the environment. As a

result, the spirit, without getting material, has been admitted to investigate the lowest form of the existence and accumulate (experience) knowledge about it. The rest of the wildlife has no such mechanism due to a lack of ability of the objective realm to penetrate the Essential realm, while the material realm is easily penetrated by the spirit covered in its energy sheaths.

1.6. How is Homo Sapiens Created?

The spirit that has descended into the objective realm is meant to get a mechanism of cognition (ability to receive and analyze the incoming information) of the material realm. As mentioned before, it needs to connect with the material body equipped with sense organs able to get to know the environment at a specific frequency range, i.e. to make multifaceted assessments of life.

However, given that the spirit belongs to a most tenuous energy, it can't be directly linked with the energy of materiality. The energy of the spirit easily penetrates the material body unable to fully feel it and hold on to it. Thus, the evolving spirit, approaching to the Essential realm and moving towards the material world consequently 'put on' the energy sheaths taken from all the sublevels including astral.

Astral energy of the subtle ethereal sublevel of the crude material realm is like to that of mental energy, as it is, although simplified, the energy of cognition. Hence, the spirit with all those sheaths on finds itself in the objective realm.

There's a counter-process going on here. All the living matter (including molecules, cells, organs and tissues radiate electromagnetic, lepton and electric fields produced by metabolic processes taking place therein. Here is how the raw ethereal sublevel, probably with some other energies of elementary

particles, is formed flowing smoothly into the subtle ethereal sublevel with its astral energy.

Thus, the astral energy included into the sheaths of the spirit meets the twin body-related subtle ethereal energy. Consequently, a unified structure is formed consisting of the spirit (energy of the spiritual realm), essential realm sheaths (mental and astral energies), body sheaths (subtle and raw ethereal sheaths) and the body itself being a carrier of the entire construction, which can be termed as ‘integrated human essence’. Having combined all the worlds, Primary and Secondary creations it allows cognition of all forms of the existence, and the material world (opposed to the spiritual life) above all.

This is a brief overview of the full cascade of energies starting from spiritual to material. There are no clear boundaries between them; they are confluent interchangeably intensifying and subduing characteristics. We can’t right away, for instance, define how much astral or mental energy one can use while socializing. It is until we get involved in a discussion of a problem that we can have a full picture.

The functional unity of energies shaping the human reason is a product of a fusion of the spirit and the body into an integrated being that we normally call ‘a human being’. The spirit is packed with energies of the Essential realm allowing for a successful management of knowledge awaiting to be disclosed. These energies are underlying in the emotional, logical, analytical, abstract and many more levels of cognition far beyond. In aggregate, they are known as a Soul with only the spirit entitled to use them.

The human mental essence and the body are fused by the astral energy, a means of emotional cognition of the environment typically evident in children in the first few years of life. When taught the rules of life, their reciprocal communications between astral and subtle ethereal energies begin to take shape. Simultaneously, areas responsible for meaningful speech are developing in the cerebral cortex. Thus, the functional integration of the human essence has been completed.

As a ‘mental energy/the body’ communication is getting bigger and matured, a percentage of emotional cognition becomes subdued and dominated by mental. However, some people sustain the emotional cognition and communication for the rest of their life. They interact using a more primitive language (monosyllabic sentences, excessive hand waving, energetic mimic, etc.). It suggests that the spirit of an individual is underdeveloped if it uses animal mannerisms.

This might be because communications are for the most part completed before reaching 7 to 12 years of age, and therefore it is crucial to be actively involved in communicating with young children using logic and analysis. All the communications will have grown used to be freely interacting with other mental energies before 20. By that time, it’ll still be enough time for an individual to be independent in their creative cognition and spiritual evolution.

This aspect is paramount for the development of the integrated human essence, and parents should be aware of it. To give birth to a child is half the battle; the other half is to ‘switch on’ the mental energies for it to live a meaningful life.

The first seven years of life prepare a basis for an individual’s further development. During these years, a future of the individual’s

integrated essence takes its shape. If the communications between the energies are properly adjusted in time, the spirit will be able to learn (accumulate experience and knowledge), while the Self will affirm its prominence in the society, and the body, unburdened by peccancy, will last longer serving its owner.

We, the living on Earth, are most interested in energy close to our life. On our way to the border of the objective realm, our spirit 'put on' different subenergies. Unlike the earthen, those were incinerating energies lying beyond the bounds and unimaginable! They shield the travelling spirit from unfamiliar crude energies It's unaccustomed to.

On our way to the Essential realm, we were getting to know abstract thinking coming in contact with great knowledge held within the information field; however, being 'spiritual babies' we had no clue about the depth of things seen and heard. Standing on the frontier of the objective realm, we'd already had mental energy built in our structure that helped us think logically and analyze things happening around us. However, we had no idea of where we were heading to and what lied ahead.

Method of acquiring professional expertise and experience is the same throughout the Universe. First goes the cognition followed by practice to train the knowledge, and subsequently 'jumping' higher to advance your knowledge, etc. It's obvious that one can't become a professional during 1 lifetime (in one body); the earthen life is highly diverse, and learning all the variants over a short span of time is just impossible making it necessary to prolong the process of cognition. It implies going through a certain phase of life, then try to analyze to find a variant most appropriate to correctly go it through, and then try to go though it right. If you can't, keep on searching.

Those life phases are countless. You can spend centuries searching and trying. In this regard, each group of spirits has a specific term to search and try which is 320,000 years, according to the Veda, and if the spirit has failed to grow into a professional, it won't be able to get back to the spiritual realm because it can't take off all its sheaths. However, it can't stay on earth or some other level of the Secondary creation either because the Universe folds up (i.e. disappears for life).

The Creator has solved this problem through reincarnation. Life experience is obtained by the spirit in a series of incarnations in a new 'sheathed' body. The incarnations can run up to 2 000, which means that running about in loincloths can happen to us more than once!

Bearing it in mind, we should remember there is not much time on our hands to lose it on mere wandering around distant reaches of the universe. The age of the civilization is many hundreds of thousands of years, but no one knows for sure how many years there had already passed by the time we came here. And we are still too far from professionalism and pristineness of the subtle world. Life has been a gift to us, so we are responsible if it's neglected. As long as you don't pay with the death of your spirit, it can be managed.

CHAPTER 2

HUMANNESS AS AN ATTRIBUTE OF AN INDIVIDUAL

Humanness is a highest virtue, the best of all merits that a person can have. Love, kindness and refinement are cornerstones of humanness. They are the ‘tuners’ into other people’s needs and interests. Indifference and cold-heartedness are indicative of the absence of that attribute. Therefore, the less humanness the integrated human essence has, the beastier it is.

Etymologically, the word can be found in German as ‘Menschlichkeit’, French as ‘Humanité’ and Latin as ‘Hūmānitās’. We may as well consider the Russian word ‘Человечность’, where the word ‘человек’ consists of two notions. i.e. ‘чело’ (a face or a person), and ‘век’ (century) or ‘вечность’ (eternity) as a measure of life expectancy. In the first instance, ‘чело’ is referred to an Earthen human, while ‘век’ defines their lifespan. The word ‘чело’ is referred exclusively to the spirit, which is eternal. It means that the notions ‘человек’ (human),

and ‘humanness’ can’t be regarded as synonyms because they denote different attributes of the integrated human essence.

Humanness is not closely linked with the accumulation of experience and knowledge; however, It’s easier to grasp the idea about the finiteness of the material life and understand priorities inherent in the spiritual life provided that some experience has been gained.

2.1. Ticket to the Paradise

We can see that the human mind isn’t a criterion to assess significance and utility of the human. Life shows that, despite being a fountain of knowledge, many people are brutal and messy. Some ‘seemingly normal’ people get in a downward spiral with booze or become homeless and lost. The history knows evil masterminds who practically brought the human race to its knees. People are being robbed off pushing them to poverty making them beggars. They are so many, and the worst of all is that they consider themselves to be chosen ones and are proud of that.

Those people are bouncy and pushy. They use the above-mentioned method to penetrate the knowledge that open to everyone who want to have it. However, this is only possible in the material realms because it has been summoned to help Earthen people survive and mature as a kind with the prospective of social and material progress contributing to the development of altruism and spirituality.

It is really not surprising because in the objective realm, the knowledge of the material world are restricted to that that can be handed over from parents to children, and previous generations. This is not enough because in this case, one can

wear that 'loincloth' forever! Wanted are 'advanced' people who look further compared to a primitive everyday routine searching and improving the environment, mining resources, bettering living conditions, and social relations. They may expect that the information environment will half-open as help from the subtle world of the Essential realm.

When dropping off the material sheath, it gets simpler for the spirit to penetrate the information field, because knowledge is within touching distance and can be used big time. Imagine you've left the raw ethereal energy, i.e. got rid of the body and are now in the subtle ethereal energy, in the realm of astral (emotional) experiences. You have no clue what to expect. You no longer have a body with its sense organs, instincts, conditioned and unconditioned reflexes. The block about previous lives has been partially off. Thoughts are unusually free, but not always happy, because now your self-awareness has become more acute and moral standards high, and they by no means justify previous Earthen misdeeds harshly criticizing them.

Those surrounding you and your own reflections are now making you think that this energy level is a 'transit route', not a destination. Here, outcomes of one's Earthen sojourn are totaled up, and consequent correction of one's conception of further travel is ensued. Some go to the limbo, while some get away with psychological adjustments.

It turns out that the Essential realm (mental energies) welcomes individuals who has gone all the way of Earthen life with dignity. What does it mean? It was mentioned that the essence of above layers, particularly the Primary creation, lies in the inappropriateness of selfishness of the material world. Love, mercy, sacrifice, and mainly devotion to those around you are

the natural forms of those energies. Everybody knows there that any misstep may lead to exodus because those layers can't have any other life principles except those mentioned above.

So what about the others? The soul and thoughts are rebellious because the road to the Essential realm is shut. Therefore, either going limbo, or comeback to earth to once again experience life situations to correct past mistakes depend mainly on our excellence. Nothing done can't be changed no matter how desperately you ask or cry for. The road will be open to the energies energetically consistent to the sheaths of the spirit. Failed to clear them? Expect to go to the limbo. Partially succeeded? Head back to earth.

In the meantime, the time is ticking away, and nobody, except for the Master doesn't know when the current civilization comes to halt and where our Spirit will be. With absolute clarity may we say that before that time, we should be finished with our earth mission, approve by the Board of the subtle ethereal level, receive a ticket to the Essential realm, and never made a misstep while experiencing it. And beyond all that, in the realm of the spiritual realm, will we find our home, our Eden which will stay forever no matter what.

Thus, we may say that the knowledge *per se* available on higher layers of the Universe can't be as significant, because it is the core of that particular energy which is the WORD, and the WORD is the GOD. In contrast, they are very much significant on earth because it facilitates survival of the body, without which the spirit can't cognize the material life. Spirituality is an absolute criterion to assess the sheathed Spirit within the subtle world. Within the material realm, it should be born and grow

despite the counteractions of the body and different ‘draws’ of the society.

Thus, the integrated human essence combines two worlds, which are spiritual and material. It reflects the unity of the Universe. These worlds live by their own laws – spiritual humanness and materialistic selfishness. Those are the opposites, and within this unity and struggle of opposites, the integrity of our common home is shaped.

2.2. The Notion of Sin

It is an issue most talked about in the majority of global religions but which make no efforts to explain mechanisms of events. Therefore, sometimes there’s some confusion in terms. The accentuation of sin in any religion is crucial because it is a precaution signaling of danger to forget God due to overindulgence of Earthen comforts. Christianity mentions major or capital sins (between 7 and 10 based on different sources), and secondary.

The Orthodox Church specifies the following deadly sins:

1. Anger, malice, revenge. This group includes deeds that contrary to love bring destruction.
2. Lust, lasciviousness, fornication. This category includes acts that lead to excessive desires.
3. Laziness, vanity, forlornness. They denote reluctance to do spiritual and physical work.
4. Haughtiness, arrogance, pride. Presumptuousness, boast, overconfidence are indicative of disbelief in God.
5. Jealousy, envy. This group includes dissatisfaction with what you have, assuredness in the world’s unfairness, a wish to have someone else’s status, property, or qualities.

6. Gluttony, voracity. Need to consume more than you need is lust, too.

Greed for money, avarice, greediness, niggardliness. Emphasis is primarily made on one's wish to boost one's fortune to the detriment of one's spiritual welfare.

Categorization of sins by their incidence and some 'vagueness' of connotations is voluntary, therefore it needs some detailing. The thing is that we don't feel correctly about the mere fact of sin. When we say about capital sins, it turns out that many of them center around the laws widely accepted on earth. Can one call them a sin? Are there no contradictions?

If we take the Universe, the life on Earth has been allowed by God; It's been organized by certain rules which are not to be tabooed. What has not been meant by Lord can be merely restricted. Let's take gluttony (# 6 of the List) as an example. Eating is necessary for survival, but the question is 'How much?' Until you feel satiety, but where is the edge? In animals, this process is efficiently regulated by instincts and reflexes. In humans, those reflexes and instincts are conjoined with mental and intellectual appraisal (previously experienced hunger, expected malnutrition, gustatory factor, etc.), and the limit for satiety are widely varied. Medical conditions, endocrine aspects, genetic predisposition are not to be dismissed, too.

So what is it? A sin or something? Why must we call something that has been given to us as an ordeal or experience 'a sin'? A sin is adverse to the kernel of the objective materiality, e.g. killing for whatever reason, except for a motivated protection of the innocent and one's own nation. Any forms of 'kinky' sexual involvements never seen in animals can also be called

‘a sin’. Bible calls it ‘filthy’. Those sins must we name ‘capital sins’ because they can’t be justified.

A misunderstanding of the processes going on in the Creation underlies all the other sins paving the way to lust, lasciviousness, pride, boast, arrogance, greed, and avarice. They are all based on laws widely accepted in our material life targeting a population life prolongation and their individual survival and originating from their instincts, reflection and emotional (i.e. astral) energy postulating their irresistible senses.

Almost everyone, unaware of Lord’s existence and ‘not-by-chance’ origin of life, will opt for indulging their senses, instincts and emotions to gain any goods, unnecessarily urgent, and more than a fair share of them if possible. They won’t be suspicious that that must be a temptation, and will be more than happy about this stroke of luck.

That is absolutely a weakness of Spirit and ignorance of one’s substance and its purposes. In this case, mental energy and the judgment become a ‘servant’ to the sense organs boosting desires making them unfathomable. No doubt, the gradation of sins and the dangers they bring forth mentioned by every religion are valuable, but when the spirit is weak, this information may be perceived scarcely or wrongly. By no means can we sometimes feel we have flouted the law when the temptation sets in.

*At this rate, we should guide our fellows into the concept of the Universe structure, functioning and laws, and the place the integrated human essence take in it. Consequently, this is not about the sin, but a deviation from their purposes and tasks to nurture the spirit. But as the Russian saying goes: **horse-radish is no sweeter than garden radish**, which means that between two evils it is not worth choosing. Whatever you call it, it’s*

bad as it suggests about the aberration from the laws of God. Therefore, we need knowledge to motivate our correct deeds.

2.3. Earthen Morals

The Universe is always trying to compel the inferior layers to life using its superior strata because none of those layers are able to run their mission individually. In this regard, whilst the spirits had been infant, civilizers came and brought epic literature, writings, artefacts and knowledge taken from god knows where to nurture the integrated humans including spirits.

Thus, the ethical principles of human life may seem to have come as if from nowhere. The first rules ever written on Earth were the code of law (compliant with Ten Commandments of Moses, 13th century B.C.) handed over to the king of Babylon Hammurabi by Shamash (Utu) (1793 to 1750 B.C.). It has been embedded on one of the black basalt columns in Iran. As for the ethical principles, as well as topographical maps by Oronce Finé, Piri Reis, Mercator, etc., they've probably been left to us by the previous civilization. Anyway, they came as a help for people to grow and nurture their spirit.

Sure enough that this duty can be performed by other beings of the subtle world, such as light angels (angels of heaven) and dark angels (angels of the material realm). The former help the spirit to mature and keep the body committed to this aspiration while the latter are responsible for the integrated human to fully perceive the diversity of the material realm and preserve the body functions based on the requirements of the spirit. So these two independent, yet opposite, services do the same job which is maturation of the spirit acquiring experience in the Secondary creation.

The ethical principles are different from religious canons but they shape the human behavior and their place in society based on the given free will. They fully reflect the duality of human being thus confirming the core of the “integrated human” notion, which represent two opposite worlds. Their rivalry, while preserving the integrated human’s free will, allows for establishing key trends for their future destiny.

The ethical canons mention two approaches to the development of the earthen human including materialistic and idealistic. The former focuses on the assertion of human’s independent role and the primacy of the material world and its laws while the latter is oriented on the primacy of the Lord and his presence within the earthen human.

Therefore, the materialistic approach favors the body and the material world based on its laws with selfishness at the forefront. The idealistic approach while not negating the importance of the earthen life, postulates the service to God via the spirit and soul. Altruism here is a key postulate.

It is not that the earthen human embarks on the given path straight away. Having the free will, they can transfer from one path to another. However, it’s all about the time constraints which are one’s lifetime. It’s crucial which way one will choose to start out to the Subtle ethereal world because one can easily fall into the in-between thus impeding the growth of the spirit.

There is no clear boundary between two ways because they are not isolated from one another, and the human being can change their leads plunging from one way to another or being on both paths simultaneously when looking for the truth or some acceptable options in life. Now being an idealist, one can become a bred-in-the-bone materialist in the next moment, and

there are gazillions of such people searching for ways to satiate their sense organs or instincts.

There is a scale of ethical canons with ethics and morality being the main guides. They denote mutual relationships and literally characterize our «one-another» responsibilities. Materialistically, it is called “the morals” mirroring a formal (deprived of sensitivity and emotions) attitude to the duty. Morality is based on legislation, e.g. constitutions, codes, instructions, provisions, etc. Interpersonal relationships are shaped on a “quid pro quo” basis. The one who’s taken a moral stand is considered ‘a right-minded’, and it’s inappropriately to ask them for more.

Idealistically, these «one-another» responsibilities are fundamentally different. The notion of ‘ethic’ (character and moral nature in Greek) bears a heartfelt, spiritual feature of character that is not been subjected by material laws or regulations. Everyone who is walking down this path can fathom that the Lord is the righteous judge ‘installed’ within the integrated human; he sees everything and watches that it finds its way through the raw and subtle ethereal worlds. Ever-present morality can make one refuse from pleasures of the material world and purify our human integrated essence, which will definitely make us spiritually more mature and perfect.

Morality and ethics define a relative border between those developmental ways. If Earthen humans aren’t right-minded and live by the ‘you-are-for-me’ principle and more into temptations and delusions, they are immoral and it’s difficult to enforce any law upon them unless they killed or stole. But if they did, they can frequently evade the law. Governmental and social systems serve that purpose well. Tenacious amorality unavoidably lead to the degraded spirit and soon the degraded body.

We can see that the structure of the Universe with its energy layers and mechanisms of shaping the integrated human combining two opposite worlds has been confirmed by ethic rules as shown in Figure 1.

The Figure gives us an insight where we can be and what we should attain to fulfill our tasks and go back to the spiritual realm. Looking on the situation from the perspective of today, we see that the main impediment to solving all our problems may include a lack of time no matter how hard we'll try, and perhaps then we'll see what the Biblical saying is about when it says that the wide road leads to hell, and the narrow to heaven.

2.4. Energy Forms That the earthen Human Can Create

The Creator of the Universe holds many secrets, the ones that neither our integrated essence, nor the spirit will ever get close enough to, let alone know them. Well, we don't actually need them that much, because we are not sure if can conceive that at all. All we need to do is to learn and conceive about what is going on with us in order to fulfill the God's will. With the above-mentioned Figure, we've outlined the structure of the Universe, our nature and mission, but the question still is: how on earth our deeds get recorded and summarized to be subsequently a basis for our future destiny to be decided?

It's hard to fully grasp all the subtleties of the process, but the general pattern is clear. The human life including conscious, social and intellectual activates processes going on in depths of the human's system involving the raw ethereal and subtle ethereal energies producing the well-known aura around a person. A primary role in this aura is played by astral (emotional) energy with its spectrum of "clear" and "dirty" emotions. This energy is tied up with mental sheaths of the spirit. As for the weakened Spirit, the mental energy is swamped by the emotional energy, which prevents it from controlling (analyzing) actions made.

The aura of animals and plants consists mainly of raw ethereal energy; therefore, the fluorescence is less visible compared to human. Investigations to assess the aura have been occasionally performed using specialized equipment (e.g., Kirlian pictures of aura). The pictures show the aura more or less intense or tattered. The aural glow depends primarily on human's lifestyle and functional state of the body.

Some esoteric sources mention energy forms building up along the aural outline produced by ethereal, astral and mental energies. Despite their small size, they are similar to those seen in human. They are categorized into Thought, Word and Deed. The life span of the first isn't long because they are numerous and produced permanently by people, including while sleeping. The second reflects a thought fully crystallized and used in speech. They are long lasting and more difficult to shrug off. The third form is durable and appears provided that the two precedent forms have been fully actualized.

They appear through the mental energy, and the body has little to do with this process: first goes the Thought, then goes the Word, and they both produce the Deed. As seen, the spirit

and the Soul keep a tight rein on the result. These forms, based on our good or evil ideas or intentions, have a full array of shades. The lighter the form, the more good it brings, and vice versa. Forms can combine and transfer from one Earthen human being to another by the law of similarity (birds of a feather flock together; like draws like; husband and wife live the same life, etc.). Shade coincidence is the main thing suggesting consistent energies and purity of the spirit and soul.

We may often see that people mix around their interests, objectives, and tasks creating social, ideological, commercial and other groupings sharing similar energies proving the validity of similarity theory. Witnessing behavioral patterns of our 'kindred' spirits helps us 'polish' our own soul. Intercommunication between groups different in their attitudes is much more difficult to achieve because of inner discomfort between them.

Energy forms come into contact first after a relationship or a group have been established, because they immediately see their kin energy. As for the spirit, it needs to appraise the looks, talk and then analyze habits, i.e. to assess 'the similarity'. The forms needn't to do it because they see the subtle ethereal realm, and if there's no similarity, there's no comfort. When two different energies collide, they have to get used to each other, which is not always comfortable, and more often than not they suffer in the hope that it has been given to them for edification.

So we'd better watch our thoughts and words in everyday life in order to hold back sinful consequences. Indecent thought or word let fall may exacerbate passage through the subtle ethereal layer, even in a moral human being. Beware of bad deeds! They live long, and one must do good deeds again and again to erase bad ones until they dissolve due to a lack of energy inflow or

move to someone with similar negative energies, or else they may set off to find a body with a similar aura.

As we can see, no “Border Patrol” inspectors are required for ‘document verification’ on the borders of the subtle ethereal world and the essential layer to validate the spirit and the soul, because energy forms of your body-deprived spirit and its sheaths are plainly visible. If your colors aren’t black or gray, you are welcome to the Essential realm because It’s been opened with your love for neighbor, humanness, mercy and sacrifice confirmed by their light colors.

If there is a single stain of dark or grey, it won’t let the spirit and the soul take off their subtle ethereal sheath, and no entrance to the mental energy will be permitted until It’s been left behind. Now, the servers of the subtle world are there for you to analyze your misstep and reasons why it hasn’t been fully resolved. Anyway, it needs to be done at this level or else by going back to the earth (state of affairs more commonly experienced). If there’s plenty of dark forms and no attempts have been made to eradicate them, no options are available except for the limbo and then going back to the earth.

However, it takes a fair bit of time to do so because one should find a potential mother who’d be in synch with them and currently living on earth. Then to make a program of living in the future body based on corrections of previous mistakes, and then incarnate into a fetus developing in mother’s womb. The first fetal movements might be indicative of incarnation actualized. What if you might need more than one of those incarnations? That process may be time-consuming, but no one knows how much time the Universe has left to us.

CHAPTER 3

WHAT'S UP WITH OUR CIVILIZATION?

We are at the turning point now. People of the previous era who would appreciate honor, honesty, truth, modesty and simplicity are living out the rest of their days. Meanwhile, industry is blossoming for us to enjoy a comfortable life, but no breakthrough discoveries have been recorded yet that would allow using the readily available environment-friendly energy sources suitable for our household and industrial needs. The fundamental science that leans on materialistic approaches has bumped into a subtle ethereal ‘wall’ behind which the knowledge is impossible to draw.

So we go on brutally wasting resources of the earth. The atmorealms are choking on hydrocarbon fuels, and we haven’t any idea what to do about it. We eat food overrun with chemicals unattractive for even molds!

3.1. Poverty of the mind as a pandemic

Epidemics undermining the planet are fading out. However, despite the progress than the medical science had attained, viruses are continually modifying themselves reminding the humankind that It's frail and vulnerable. These factors target the body, and the spirit to some extent. Still, there is a number of diseases, which are associated DIRECTLY with the weakness of the spirit. Those include a pandemic of mind poverty.

The notion of the mind has a variety of connotations including the following:

- a universal capacity to comprehend all that's happening now in the world, offer adequate solutions and sort out the situation on the whole;
- an ability to manage multifaceted knowledge;
- a more subtle energy substance resulting from the ever developing mind.

Abstract thinking and wisdom are crucial in the game. They help not to pander to one's emotions and feelings, but differentiate between the useful and adverse in the long run. Success, intelligence, education, achievements and even genius are no guarantee of one's right-mindedness.

Researchers say (see *Proceedings of the National Academy of Sciences*) that human IQ estimates have been gradually dropping over the past several decades, probably due to changes made in the educational system and within families, as well as changed eating patterns or media. However, no clear explanation has not been given yet.

Back in 1984, James Flynn, the British scientist published his manuscript 'The mean IQ of Americans: Massive gains 1932 to 1978' in *Psychological Bulletin* which described the

phenomenon of 15-point improved IQ estimates observed in Americans over the previous 4 decades, and which was later seen worldwide. However, starting from 1970s, IQs started falling in a number of countries.

Authors of a later work, Bernt Bratsberg and Ole Røgeberg with the Ragnar Frisch Centre for Economic Research, have analyzed military conscription data taken from 730,000 Norwegian young men covering the period between 1970 and 2009. The study included men born between 1962 and 1991. Age of the participants was 18 to 19 years old. The mean IQ test score for those born in 1962 was 99.5 while it was 102.3 for those born just 7 years later. This value dropped to 99.4 scores thereafter.

The technological progress prompting easy satisfaction is the underlying reason for poor mind. In this situation, it feels natural to reduce physical and mental workload using state-of-the-art technologies. As a result, brain's functions have been in part handed over to gadgets including calculators, smartphones, computers, and the Internet.

Anthropologists say that over the last 100 years, the human brain has diminished by 150 cm³. We thought that we'd succeed having given some of our simple brain functions to technology, but instead, we can no longer remember phone numbers, operate double figures, seek truth in books, store necessary knowledge in our head. There's no need for that now because everything can be found if you're online 24/7.

Some of our brain's grey matter has been out of use and not required, so it is being gradually replaced by gliosis and connective tissue which will further contribute to cerebral atrophy. The latter seems very likely because no new ways to 'load' our brain are expected in near future, and what is more, we are ready to give

in our intellect to androids. Mental energy will be deemed to be unnecessary as well as the spirit. The Secondary creation has been made for the spirit to grow, and we are killing it without remorse?

We invent programs to fully mimic human emotions that make astral energy practically useless. The human race won't probably make it out to it because by that time it may have become a sort of 'appendage' to androids and their artificial intellect. And even then this seems doubtful, because humans might have been already lost and no longer needed.

Artificial intelligence is nothing but a simulation of God-sent logical thinking, no matter how sophisticated it may seem. Transition to a higher level includes one's creative efforts as well as knowledge of laws given to us by the Lord. The artificial intelligence can't be simulated as it needs to be done with an entire gamut of emotions, but it has no sense organs and subconscious answers led by the astral body. Any imitation of this process will be counterproductive. Robotic and simulation technologies often show great excellence in executing tasks but still they are a bunch of metal operating commands.

Bodies can propagate by virtue of nature, but they are animals without spirit. Artificial intelligence mimicking humans must not be allowed, because routine intercommunications will inevitably contribute to mental degradation. Still, prohibitions are frequently neglected because poverty of the mind has managed to destroy global law institutions all right.

Fake relationships have become a trademark of governments and global social institutions. They lie blatantly and inspire events framing and blaming people and states. Fake diplomacy has been a standard behavior for those who must stand up for truth, honor, professionalism, and accommodate global interests.

It's no random episode in our history, but rather the events induced by definite causal relationship. Over a protracted period, survival had been our number one target, and most of us were modest and undemanding. Then we started searching for ways to hand over physically challenging labors to machines. It helped to preserve good health for a longer period in order to serve the primary goal, which was spiritual maturation.

But then, watching the comforts those machines could bring, the academic world started working on facilities substituting activities of the brain including calculators, computers, iPads, Internet, and now androids. That would've not damaged humankind at all if all those devices were used for industrial purposes or statistical and scientific data processing!

In contrast, those gears for individual use have caused some serious difficulties. The thing is that a 'switch-off' of some regions of the brain due to irrelevance for routine, socially meaningful activities contributes to atrophy of those regions. If it were just brain volume reduction, we wouldn't have probably noticed, but It's much more complicated!

Production systems and supersystems have been produced to fulfill strategic tasks faced by human race. Communication processes that are key for society are not really affected by them, while fewer communications abase intellectual motility and mundane thinking. Once the information has been put into gadgets, there is no need in memorizing, discussing, analyzing, using catalogs, fishing info out of books, and thinking, after all. Press the key and be a genius!

The body thrives on it because as real-life situations becomes scarcer or rarer, the intensity of survival becomes diminished, but both of them are crucial for the spirit to grow. ***Reduced***

functionality crimps the formation of moral life due to a narrow thinking pattern, and paves the way to material selfishness and poor humanness. Mundane activities in many ways simplified make the material world seem more meaningful shaping consumerism craving for everything.

Now we are living on the watershed. Attitudes and priorities are changing rapidly. Everyone hopes to escape the nuclear war not knowing that this option seems to be the best to end the civilization compared to the decadence of the mind. At least the spirit won't be tainted and destroyed by our own foolishness.

In every respect will the human race suffer, but as for the top tiers who misinform the public, things will be even worse. One must not violate the world order, kindling the flame of international clashes and striving for profit at the sacrifice of one's spirit for the sake of personal or common interests. It should be clear that everything will have to be given back sooner or later, but the spirit will be difficult to recover.

The assessment of the situation seriousness is impaired by the fact that most people have mild mental deficiency (more than 85%), although not so apparent in everyday life. Indeed, one shouldn't be brainy to deal with mundane tasks that customarily involve reflexes, sensations and restricted mental analysis. Therefore, mild mental deficiency in some people produces doesn't affect social development. Still, there will be some tendencies for progressive intellectual changes in that society because families of the following generations won't be focused enough on intellectual upbringing of their progeny; besides, the intelligence of that rearing won't be that high.

Data suggest that a significant portion of people who'd been previously diagnosed with 'mental deficiency' had no organic

brain damage, and their low IQ was a product of parental, pedagogical, or public neglect. Those children had been raised primarily by alcoholic or low-income parents, or in single-parent families. These conditions are a good prerequisite for subsequent ‘Mowgli syndrome’ or ferality of the children.

Mind scarcity has also been associated with the development of social relations and better human wellbeing. Two periods of judgment formation can be differentiated:

The judgment of survival (or evolution)

The judgment of temptation (or involution)

In the former case, the mindset is primarily focused on the cognition of nature, elaboration of skills and contacts with the environment, improvement of co-living patterns, building nation states, etc. All of this required permanent brainstorming and memorizing in order not to ‘reinvent the wheel’. That complied with the Maker’s concept in full measure.

In the latter case, everything is more or less stable, and there’s no more need to survive for most of people. They have their state, legislation and social security systems. Nourishment, better or poorer, is at their disposal, no danger of famine. That’s when seductions come to the fore inducing one to have more and better. Possessing those things boosts self-importance resulting in craving for even more. Although wide, the circle of wishes is quite single-type – no intensity, broadness or depth. And along come iPads, Internet focused on no more but seducements resulting in a sort of ‘truncated’ mind.

At the same time, it must be understood that the grey matter develops due to not gene codes, but rather the intellectual and memorizing training of the brain. Moreover, minds the most sophisticated cannot guarantee highly intelligent and socially

prominent personalities unless there show human decency and other nurtured virtues we call 'humanness'.

3.2. Democracy

Degradation of the mind gradually guides us to degenerative social processes requiring good apprehension of particular events in order to find ways to block them. There is a host of negative social factors accelerating mind degradation including social processes wrongly interpreted due to a narrow-mindedness.

The notion we commonly use is 'democracy', one of the most precious values of free society. Democracy serves as an 'incantation' to shape public opinion and justify un-democracy. The history of liberal values shows the non-conformity to the values we hear constantly declared allowing all-permissiveness, seductions, departure from the foundations of human person defying the God and his laws. Degradation of the mind won't probably disappear, so liberal concepts may yield debilitating social processes that would be domineering society producing societal degradation and decay.

Democracy denotes 'rule by the people'. It's not easy to give a clear definition to democracy due to a complex nature of political and social relations, lack of unity and various physiological, mental, social and economic developmental factors of the society. Still, it can be put as an arrangement of community when all its members contribute equally at each significant stage of management. Tolerance, diversity of opinion (pluralism), co-existence, and competition of a wide variety of social and political views are constituents of democracy.

Additional key notions of democracy include equality and rights implicitly slightly opposite to one another. Democracy

seemingly asserts natural equivalence of people provided that their life is subjected to the rule of law. However, the rise and progression of bourgeois society has changed the attitudes on the assessment of merits for the society and the distribution of benefits associated herewith. A social status had been already explained by personality and merits of an individual. In ancient times, people knew that people as *demos* (demonic energy) was a heterogeneous structure that needs to be considered individually based on their development, significance, property status and income qualification, habits of work, etc. Therefore, notions of classes and social strata had been introduced.

People can't be virtually equal within the objective realm, i.e. on earth. Some doesn't want to benefit society and themselves at all. Some work under the whiplash, while others do it conscientiously. Someone is lettered while others illiterate. Somebody has taken great pains to sharpen their intellect whereas others balked their chance. Individuals with great mental plane hold key positions because they know more. They are joined by highly qualified professionals and creative community.

Social scientists, philosophers and legal experts declare that democracy where the will of the majority is restricted for standing up for minorities and separating individuals, is a progressive social pattern. The attitude is no doubt humanistic, but brings no logical signs of equality between, for instance, an imbecile and a Nobel prizewinner; a destroyer of family values and a conventionalist living in full compliance with God's concepts.

What is meant here is that society must design decent environment for those who can't make up acceptable social settings for themselves and bear those responsibilities. At the

same time, to indulge idlers means to aggravate their situation, as they will have to pay the bills later.

The same is when dealing with disabled individuals suffering from various medical conditions including locomotor, mental and other dysfunctions. Compassion, sympathy and humanness are always appropriate suggesting moral health and ethic. But too much mothering and preventing them from manageable work is bad and does more harm than good because their sufferings echo the way they choose to live their past lives, or they are sinful in the present. Too much nurturing will make most of them live with their ailments over and over again.

But what about freedom and equality? Can freedom be given to someone having restricted intelligence or living socially troubled, criminal or parasitic life? We can't be all equal because we are different in attitudes and aspirations.

So what is the democracy we are talking about? Jack London proposed a notion of democracy, probably most correct suggesting that it is 'a dream of the stupid peoples'. That is so true! Overall equality can be accomplished in two cases: religious, because 'all men are equal in the face God', and legal, in unquestioning fulfillment of legal rules. A most accomplished scientist or a king, as well as a fallen one are equal before God and have similar prospects here on the material plane. A for the second case, we've seen enough how easy the law becomes lawless. You can't hide from God, almighty and all-seeing, and everyone will be liable for debts because Earthen laws can be twisted either erroneously, or intentionally.

In addition to London-esque democracy, it is an instrument of the cheaters taking the notion as 'a fetish' to pray for and shelter themselves. It's long been known that the struggle for

democracy is a convenient excuse to shift from the existing order, get an admission to the public trough or energy sources.

No doubt that the thesis of struggle for democracy is sheerly pragmatic without a hint of morals in them. The earthen laws can't be an alternative to humanness, as they are mostly punitive at their core, while humanness is merciful. Therefore, in the absence of humanness and mercy they can't fully reflect the needs and aspirations of sentient beings. They are flawed *a priori*. But we have no other options, and won't probably have.

The man of today must get a full grasp of what the notion of freedom means. Nature has no freedoms, but laws! It means that the material realm comprising the Universe, the Earth and the Human, can't be fully free to act. It is restricted to the laws of the nature. Therefore, everything, which is not alive, or alive but lacks in reason can't affect processes happening on the earth. We must take it as a maxim, for this is the law of the creation. Freedom is an attribute of the mind, which belongs to mental energies, i.e. the Subtle world, and hence the spirit. It means that the spirit, when being developed and perfected will appreciate the meaning and the cost of this concept.

Liberalism with its democracy and tolerance (political correctness) has given rise to the tyranny of minority over majority. They've opened the gates for the impoverished mind to cross the way to degradation. The minorities living in healthy societies always had opportunities to clean their spirit looking up to the 'healthier' part of the community and concealing their inclinations for breaking the laws of nature. Now, holding power, they corrupt the majority pushing them to degrade having worked out methods to manage the masses and orchestrate color revolutions on a global scale.

Those are not the laws of God, because such liberalism kills the present structure of social structures without giving anything in return. It's unlikely that people mean anything to them; they care about their own prosperity, exaltation and temptations requiring people to work and stay numb and dumb.

It's become as clear as noonday, but they are not going to give up on their ways. We are living in an era of poor reason and ongoing degeneration; therefore believing in their soundness is as silly as adopting their liberal values. The Lord has probably anticipated and tolerated that. Leastwise, this is a good lesson for those aspiring for spiritual growth.

3.3. Pandemic of Consumption

Let's call it 'a refined selfishness'. If food consumption is restricted by satiety in animals, it remains ignored in weak-spirited humans who can't control their greed and indulgence. It might mean that logical thinking, having received a permission from a poor spirit promotes indulgence of the body, and if selfishness could be initially explained by actual hunger and metabolic factors, later it would result in a habit to consume more you need becoming an individual's part.

The same is true for clothing, adornments, money, and other wares. Not so many people could be as self-indulgent last century as we are now, but somehow, it's become fashionable and flashy. 'You look cool!' is music to someone's ears. Being in the spotlight, alive or dead, is what counts the most. Acquiring everything that is wished for has become extraordinary.

All-permissiveness allows sexual perversions, sex reassignment and other obscenities.

The question: is there any hope out there for us to fulfill our human destiny? How about those who are forcing this lifestyle onto normal people? Do they really hope to break free from the material realm? How come? Lucifer's team must be rubbing their hands looking forward to taking charge of them following them to the other side!

It's hard to be justified, because we've had enough time for nurturing our attitudes. We've been lazy and seduced. We thought we'd get away with that!

3.4. What Are We Supposed to Do?

What is it all about? First, a mind-blowing scientific and technological progress has been dominating our lives. Second, we'd been rapidly losing our human face for the last century. It hadn't been previously excessive, however, it would be spreading freely within the minds of many, especially middle-class and literati making communities nobler, graceful and more sensitive to meanness, greed, and callousness.

Good and evil are relative philosophical concepts, antagonistic in their nature. However, if a force appears which defines the need (feasibility) of any actions, these notions acquire a more definite meaning. While in the material realm, earth in particular, selfishness of living organisms, including animals, can be crucial for survival and species conservation so one can't consider it evil. However, if this is the case for an Earthen human being endowed with reason, selfishness should be treated differently. In this context, it can be regarded as evil and sinful because the reason is no capacity of the body, but the spirit, which is superior to the laws of the material. The spirit yearns for altruism; something done out of concern for another's well-being. It can

be found in mercy, sacrifice, and other virtues. Therefore, there is that irreconcilable battle between good and evil going on, the one between selflessness and selfishness.

Still, this fundamental way has not been subject to the whims of fate. The Lord has incorporated some steady mechanisms regulating the evolution of the spirit. Scientists say that any process in any community, from bacteria to sentients, are arranged in a way that two thirds behave as selfish, and one third – as altruists. This ratio is still.

As for the humankind, it looks like this: some spirits fully mature (packed with enough altruism and skills) depart for the subtle world to further develop and become replaced by selfless spirits living on earth and progressively evolving, i.e. refusing from egoistic patterns. They are subsequently changed by those who'd been previously notorious pragmatists unable to abandon materiality, and who'd undergone purification from the crude etheric realm.

These two groups of individuals are of paramount importance. They might be indicative of a non-random linkage of the biblical numerology with the above-mentioned mechanism. A permanent proportion of 66.6% maintain a position of egocentricity (666 is the number of the beast), and 33.3% (Jesus Christ's age) - of altruism.

The Creator configured to a joint maturation of the spirits to allow a side-by-side comparison of whether the chosen path is right. One is expected to learn from their own mistakes and the mistakes of those walking by. When one is drawing near a certain moral degree, one begins to loathe immoralities they have to face in everyday life, striving for people of moral values. Such is the law of similarity.

3.5. Exploration of Other Planets and Creatures from Outer Space

Immigration of earthmen to other planets is a sort of fantastic, and it's not that we can't succeed in making it a reality, it's about what for. If it's just a scientific curiosity, fine! It's always good to keep on searching! But if it's for immigration purposes, it raises questions hard to answer:

Of course, it has nothing to do with the spirit, because disembodied, it can navigate the subtle world using the physical constants across the Universe, but it has its own tasks and responsibilities concerning maturation, which it will be surely engaged in here on earth. But we are taking about the material body which is getting old and dies. Therefore, the issues of gene pool are prominent. It's no people's problem, but the Lord's plans. If he pleases, the gene pool will be where it must be. In case our civilization is played out, the Cro-Magnon gene pool will have become of no use and can be used in other places and times. Even the bodies of degraded spirits might be suitable for preserving the gene pool, and be preconditioned by genetic engineering which looks like something already happened here on earth.

Yes, there can be situations when prerequisites for the death of our planet may occur. But massive immigrations to other planets are pie in the sky. The earth have no resources for that. No planets close to us exist that could be suitable for living in our material bodies, and the civilization will wait forever for Venus or Mercury to become livable.

Moreover, there has been no protection from cosmic rays yet. Before reaching the destination, travelers will have been killed by long-lasting flights they'll be experiencing. Our planet

is engirdled with underground tunnels communicating with underground cities suggesting the presence of infrastructure of previous civilization which had had to save themselves from radiation exposure deep under. Their traces can be found everywhere. Although it have been several millennia, but debris of radiation and underground infrastructure fully developed remind of vagaries of Earthen life.

Long-lasting exposure to space environment affects reproductive functions of Earthen people. Procreation in the extraterrestrial settings will have been over before it even started. A good example would be the West African Dogon tribe who's been living primitively but managed to preserve their own identity since antiquity. They know about Sirius, Solar system, and the Big Bang theory! They assume Sirius to contain three astronomical objects. They knew about the second star long before it was discovered.

One of the tribal legends says that once there came Nommo and brought two pairs of twins, i.e. four individuals. Wasn't it a homo sapiens? Weren't those twins the future four human races?

Another problem is plain to see. Going to live on other planets seems useless because the humankind has failed to learn how to use God-given blessings and benefits, which has nearly squandered the nature of the earth. We've failed to preserve what we used to have but we want to make up something brand new.

There are signs showing that it's time for the earth to get clean of the disruptors. We'd better channel all our efforts to restore natural mechanisms of earth's self-purification until it's too late. We'd better stop mindlessly rob the nature because we'll be never forgiven for our villainies, and we have no more place to go, actually! The humankind had probably done that

before, and we can clearly see the results on Mars. Yes, some of Martians have probably become a part of gene pool for Homo sapiens at some critical point, as well as those four from Sirius. However, we are going to go back to ruins and under those Martian tunnels left by our ancestors.

There's a poke-hole here associated with the spirit of immigrants which is unlikely to be developing in new circumstances.

The New Testament says that some angels of God (guardian angels) saw that Earthen women were good, and they came to Earth and had children with human women. So, they traded life on the subtle level for the material, and taught their progeny what they had to learn for themselves, and the Lord said that they would never had their spirit fully functional, because that was not stipulated by the law; instead, they would have an evil spirit (which had not been probably energized by the Holy Spirit). It suggests that the Lord has his plans, and any deviations will inevitably lead the spirit, the key figure, to nowhere.

What about the immigrants? If they manage to procreate, the progeny might lack the good spirit, as well as the immigrants per se might be deprived of the Holy Spirit's help, because they need appropriate circumstances for their spirit to evolve (contacts and life situations to learn).

Questions about aliens typically emerge when thinking about their intervention in our lives. Many screenplays about aliens attacking the earth to enslave its people and conquer the planet have been directed. Still, history presents no evidence supporting that scenario. At the same time, we have examples of some 'help' offered to the humankind in the face of disasters, dangers or wartime.

Since ancient times, there have been omens bearing prophetic significance in the war times ceasing battles or boosting faith in righteousness, making military leaders change or call off their war plans. Some force turned off push buttons to launch nuclear missiles to Vietnam during the war with the United States. Nine meteorite falls have been documented since the beginning of this century. The most prominent were the Texan and Chelyabinsk meteors. Scientific community thinks that the humankind was saved from death because they burst before they reached the earth. Although small, their strike would have been be equal to that produced by several atomic bombs.

The Tunguska meteor is assumed to have exploded in the atmoreal, too affecting the earth tremendously. The humankind was lucky enough, and the flare-up fell on the deep forests of taiga. Scientists think the Fukushima Daiichi nuclear disaster could have become a global disaster, too but they managed to prevent reactors from blowing up. UFO experts and artifact hunters note that people are repeatedly protected by supernatural forces against their own follies and natural disasters allowing their spirits to evolve unless some of the most promising can accomplish their task.

Thus, a group of Siberian hunters and investigators witnessed iron boilers emitting radiation, and probably other emanations dipping into the marshy soil over the years. As legend goes, the boilers knocked down flying objects dangerous for the earth (asteroids, comets, etc.) using directed rays. Data describe objects, flying and floating, large and small which occasionally help people in danger but quite 'cross' with those excessively curious.

It's no wonder because the Secondary creation is inhabited by a great number of beings responsible for many tasks, and it's fairly probable that we will execute the very same functions in due time, otherwise what they are teaching us so patiently for during our Earthen life? The laws of God have been proven effective by the eternity, but the spirit has free will the God won't break to make up a "creative mind" mastering both knowledge and raw emotions. Before that, the integrated human being will have been taught through trial and error, which might bring about successes or disasters including those of global scale.

That means that people need a sort of invisible and efficient help that might be appropriate while fulfilling their tasks. It might be rendered by guardian angels (bright angels), dark angels (the Lucifer's team), and teachers (i.e. advanced Spirits) who don't come back to earth. The subtle world (the subtle ethereal and essential realms) is packed with excarnate spirits undergoing the learning process on other strata. Additionally, there is a multitude of 'technical' workers there travelling on mammoth objects, which can be occasionally seen by astronauts and astronomers, with some of them going round the sun.

There's another group of essential beings going round the earth and under water, able to morph into anything including human. Those are the servants of Lucifer. Global religions tend to restrict the role of Satan presenting him as the God's rival. One should keep in mind that the Creator is almighty, and no creature can be an alternative to Him. The Lucifer's team are the servants of God, too, but if a guardian angel represents the subtle world, being 'the carrot', a dark angel is responsible for the earthen life (Lucifer is a prince of this world), and he is 'a stick'. Inasmuch as Lucifer is the prince of this world, he's

responsible in the body evolution, focus on pragmatic and selfish life, gene engineering techniques, and recovery of gene pools.

As stated by the Book of Enoch (Enoch 11, 33), the fallen angels have taught people magic, sorcery, astrology, and other occult knowledge, as well as other practical skills, arts, ink writing and paper use, metal ore extraction and processing, arm development, art of war, abortions, cosmetics and adornment use. Thus, Azazel taught people how to make swords, use ornaments and cosmetics. Amezarak gave people conjurations while Armaros taught people how to break spells. Barakal and Temel showed how to read the stars, and Kokabel - how to read signs. Kasdeya, the Guard Angel, showed how to cast hex. All these 'gifts' have yielded a whole lot of mischief and obscenities further corrupting sinful people.

Nevertheless, it meant to be that way, not otherwise. Morality has taught us about this way. It makes humans perceive their body needs with its sensory receptors, reflexes and instincts constituting a pragmatic (egoistic) way of living, which is antagonistic to the spiritual (idealistic) way. Both ways are to be learnt and understood without sticking to neither of them. The human being should switch to the idealistic mode of life, which will bring them back home to the spiritual realm.

Paranormal experts, as well as religious scriptures suggest there are special clandestine laboratories where Lucifer's team is engaged in genetic investigations using genetic engineering to spawn bodies to appear in specified conditions and epochs. There used to be minotaurs, chimeras, centaurs, gargoyles, goblins, dwarfs, gorgons, dragons, trolls, fairies, etc. Within the material realm, Lucifer's team is free to invent anything including living beings and move gears that can easily pass for

aliens. The above-mentioned boilers and paranormal events might be their doings.

We'll hardly meet aliens from outer space. They must not come into contact for a reason. First, a contact might be possible provided equal stage of development. Still, the question is: why go to the far-away worlds, if it won't benefit anybody? Second, if creatures from outer space outdo us in their development, they won't communicate without weighty reasons because it can affect our own development progression. The most mature of us understand that fine. Third, if they are inferior, they just won't be technically capable to fly away from their planet.

There's only one option left that might be employed only in case of fatal disaster on any planet inhabited by highly developed creatures. Only then, some of those creatures could opt for arriving to our planet and assimilating. Not until then need we to wait for them to give us knowledge or technologies. Jesus Christ was the last who saved and taught. We've been left with the New Testament, Koran, Veda, and other treatises, and as said, we shall make our own fortune perceiving the world around.

So we take beings taking charge of the operation of the planet and the environment for aliens and inflict ourselves on them so as they have to shield and hide occasionally resorting to visible tricks of lighting. However, the Orthodox Christianity assumes that that could be the workings of Lucifer's dark angels making it appear as if extraterrestrial beings are a constant threat to us causing us to defend. They make it seem as if the advent of the savior is feasible, and that's when the devil may try to come in the savior's guise. The Scripture states that chipping people who'll lose their freedoms and rights will be the signs of his arrival, and that will inevitably lead to a new anti-human world order.

That will put an end to the civilization when the spirit will become nihility. That will be probably let by the Creator for those who hasn't yet lost prospective to save their spirit. Not until then will it be all over, because there will be nobody left to save anymore.

Georgia Guidestones, a granite monument in Elbert County, Georgia, are the precursors of those future times. It contains six granite slabs weighing 107.840 kg. One slab covers 5 more, with one being at the center.

The monument contains a long inscription in eight modern languages including Russian, with a shorter inscription at the top in four ancient languages including Acadian, Classic Greek, Sanskrit, and Ancient Egyptian. The Russian text goes:

Maintain humanity under 500,000,000 staying in perpetual balance with nature.

Guide reproduction wisely — improving fitness and diversity.

Unite humanity with a living new language.

Rule passion — faith — tradition — and all things with tempered reason.

Protect people and nations with fair laws and just courts.

Let all nations rule internally resolving external disputes in a world court.

Avoid petty laws and useless officials.

Balance personal rights with social duties.

Prize truth — beauty — love — seeking harmony with the infinite.

Be not a cancer on the earth — Leave room for nature —
Leave room for nature.

Those sentences seem reasonable on the surface but titled the 'Ten Commandments of the Enlightenment' but they, represent

a list of recommendations to establish the New World Order on the planet. They are primarily focused on shrinking population, the world government, and shift in social and spiritual paradigms.

The government will appreciate a population as long as they produce a product. The elite will be bestowed with natural resources. Chipping will become omnipresent, as the population that preserve the free will is difficult to control. It echoes colonial slavery, but under different circumstances, when people are no longer needed. Everything will be contingent on robotization. There will be some visible improvements for the earth but what for?

The authors of ‘the recommendations’ didn’t wish to be named. They’ve left a sort of an explanatory note informing the public about the ‘ideal world’ from the perspective of a secret society person. They think of themselves as ‘pastors’ of our lives here on earth. They think that couples who are not well off shouldn’t have children because then they’ll become a burden for their community, and besides, there’s not much sense in raising children in the overcrowded boat of life. In this regard, we can be sure that it has directly to do with occult groups and adepts of the New World Order. The thread leads to the Lucifer’s team.

3.6. Digitization

We are living at a time of rapid transition from analog technologies to digital. Analog technologies are a piece of information, which is not transformed into a digital. The Morse code was the first-ever method to digitally transfer information. Letters are encoded by combinations of short (dots) and long (dashes) signals with spaces (silence) between them. Whatever

the signal, voltage or frequency, there's only three components that transmit the information but can be restricted to two – signal and silence. The availability of a signal is one time unit; no signal is nil.

Most of us have no clue about mechanisms of how digital technologies (cellphone included) function, although we all routinely use them. Therefore, experts say that the society is still undergoing a digitally primitive era.

Internet is thought to be permanently affecting us with its abundant information making them think that digital media brings evolution for the human race. Therefore, we'd better learn to live in this kind of environment, have the abundance, select the valuable from what is downpour on us, and take responsibility for our choice. This technology grants an 'unprecedented freedom' with no information or knowledge monopoly. You may ask any question to any person all over, and get an answer while the educational system must adjust somehow to this new paradigm.

First you may feel euphoric when thinking about the broaden options associated with this 'progress'. Then it becomes unclear, what does the evolution of spirit have to do with the advanced technology, especially since the educational system is to be revised, i.e. 'to teach evolution'? Now the educational system must produce 'a complicated', complementary to a smart person, a person who knows how to act, treat the information and do right in case of emergency.

It should be mentioned that the mind has been given to human beings to make them smart, not complicated. Owing to the intellect, the mind draws itself near to the spirit to serve. A complicated person is just next better to a robot. Scientific materialism states that we are watching the revolution of

complexity, which is primarily a revolution of mentality. It brings about the person having ‘excessive degrees of freedom’.

It must be learnt that the earthen person will never and under no event be able to make a revolution of mentality, because It’s a domain of the subtle energy in the structure of the Universe. They can flow in provided that the spirit will grow. Of course, skillful ‘swimming’ in the pool of information requires serious professional qualification; however It’s not an educated person who operate their abstract thinking, but just a hardwired professional. They can dub them as ‘biological robot’ to be replaced by a robotic workforce with a more sophisticated program.

Astonishing is the statement of Jack Ma, the founder of Alibaba Group, that EQ and LQ, not IQ will be requested in near future . This is what none of machines with most advanced artificial can do. Therefore, there will be communication; there will be love.

What love? Digital love? Love is a function of astral energy, and if to speak about the quintessence, it takes abstract thinking and human virtues fully shaped.

3.7. Original Sin

The Christian doctrine postulates that the human nature is sinful. Although scientists have proved that the Old Testament doesn’t mention the original sin of humanity, or transition thereof to future generations, or redemption when describing the fall of man. It suggests that in ancient times, *rituals and sacrifices were individual used to redeem one’s personal sins*. Such has been written in sacred scriptures of Islam and Judaism. As for Christianity, it had proclaimed a doctrine about the original sin and Christ’s redemptory mission after having borrowed

concepts from other religious traditions, while the negation was deemed heresy.

Saint Ignatius Brianchaninov writes that ***human being represents a complete harmony of spirit, soul, and body....*** *The spirit aspires to God; the soul is linked and freely subject to the spirit, while the body is subject to the soul.* Such was the first man. Having the lucid mind, ‘Adam called all the beasts by their names’, which means that he was presented with physical laws of the universe, but at the same time, he had to develop and grow like angels did.

To promote his spiritual growth, the Lord had given him a testament: Don’t eat the fruit from the tree of the knowledge of good and evil, but given him a free will so as he would choose good for himself, and given him the law (which fruit can be eaten, and which not) to ‘exercise’ the free will. *Still, Adam was tempted, and therefore experienced the good which lies in submission, and evil which is in the disobedience to God’s will.* Saint Theophilus noted that for Adam, it was an exercise in obedience and disobedience.

Tempting Eve, the snake was openly slandering the God saying that tasting the forbidden fruit would make people sinless and omniscient; that they would be like gods. Having being tempted by the devil, Eve would see the forbidden tree as she’d wished it to be, not as it was.

That’s how the original sin has been presented to the humanity since ancient times. To make it easier for comprehension, allegories have been used to help to feel the consequentiality of processes described. The emotional disposition helped one to sustain dynamics and unique features of the events in their memory.

So why on earth they'd quit developing Adam in the spiritual realm and sent him to earth instead? Because there, they might have taught him some fundamentals of spirituality, yet only primary spirits know why. It means that the key target of sending him to the Secondary creation, particularly earth, might have been the need to learn the earthen reason mixed with the energy of emotions (astral energy) as well as principles of the material life. The road to get there is narrow while bodily temptations are profuse. Moreover, the body and its sense organs is a 'prime customer' of wishes and temptations. Blocked by crude energies, the spirit runs the risk of being lost in the Secondary creation and consequently die.

Therefore, the admonition had been given to the spirits living on earth and knowing the mere good in the form of a beautiful and seductive forbidden fruit to know good and evil. This scene has been a derivative of the unity and contradictions of lives spiritual and Earthen. In this regard, the allegorical story narrating about the original sin has been included into the Old Testament, which is even known by those strange to living an idealistic life.

Such was the Lord's help to spirits studying the fundamentals of life within the Secondary creation, including earth. Underlying is the obedience to the will of God and the reminder about the eternal life in spirit in contrast to transient and mortal life full of deprivations. Therefore, disobedience to the Lord's will shall be classified as evil due to a spirit's failed mission and high risk of death.

In daily life, we often see that the forbidden fruit is tempting and sweet to taste, but not always satisfied after having got a bit of it. It suggests that our free will may shift our mind to a

wrong track. Therefore, it should be remembered that nothing comes from nothing; we promote our reserve and discretion when facing temptations.

3.8. Human Genes and Ape Genes

On June 1, 2018, the Russian state news agency RIA Novosti reported that geneticists found NOTCH2NL, a gene of the human DNA responsible for uncharacteristically large dimensions of the brain, and the unique structure of cerebral cortex. That news have prodded scientists into stating that the growth of the brain is a key factor fostering the evolution of the human race. David Haussler from the University of California (USA) told that they managed to discover molecular mechanisms involved in the development of *Homo sapiens*, which turned out to be ‘switching on’ at the earliest stages of child’s brain development.

Here is the entire piece: “Human genomes are 99% similar to those of chimpanzees, however our nervous system undergo different stages of development and suffer from different medical conditions with age. Those discrepancies prevent scientists from using apes to investigate medical conditions and facts about how humans acquired ability to think and speak coherently.

Neurophysiologists and geneticists assume that the key reason of that dramatic difference between two species lies in not so much the brain structure as its different activity observed in different brain regions.

David Haussler et al. have found that ‘holy grail of the human brain evolution’ while studying the structure of different genes available on the human first chromosome.

The brain of the apes and humans undergo almost similar changes. Watching the activity of those DNA areas using

cultures of stem cells, Haussler et al. noticed a simple thing other research teams have omitted. They have found a ‘spare’ gene within human cells which is absent in neuron samples of chimpanzees, gorillas and other primates”.

There has been a lot of research to obtain those data but the results are interpreted lopsidedly (too much materialistically), and give no clear picture of changes we have been witnesses to. This is much more complicated than the results presented by the author. The comparison of the modern Cro-Magnon and the degraded fellow creature can’t seem to be correct because they live lives in the fundamentally different fashion. This is pivotal in determining similarity and discrepancies between them. Tissue arrangement and baseline genome (a ‘spare’ gene functioning in the human DNA) might constitute their similarity, and even then it it’ll be quite loose.

How can the nervous system of the human perfect creature and the timeworn degenerate develop similarly considering that the former cultivates it while the latter has lost even its vocal apparatus as useless. In the Cro-Magnon, high activity of brain regions is associated with abilities to think through mental energies whereas the degenerate can only make do with the astral (emotional) energies. The remaining mental energy allows obtaining better results while training compared to other animals. Trying to examine coherent speaking and thinking capabilities in those degenerates instead of trying to embrace causes of their dehumanization seem odd to say the least.

It doesn’t take a genius to know where the evolution comes from and what it all means. First, everything happening in the Universe is associated with and dictated by the superior energy. Nothing will ever survive without it, earth included, and if the

human being evolves and is creative at all, it suggests that they have an intrinsic structure of a superior energy (from spiritual to astral) within without they would have spiraled down into the animalistic existence.

Therefore, the spiritual involution derived from the negation of the above-mentioned energies and the entire Universe (God included) is highly adverse to the earthen mission of the human being. As indicated previously, not a negation per se, but a lifestyle neglecting the laws of the Universe contribute to pragmatic thinking patterns, diminished reason, loss of humanness and other vices.

Spiritual reversion will ultimately contribute to a reversion of the body followed by diminishing signs of the Cro-Magnon appearance replaced by the animal appearance adjusted to a local natural environment with bodily functions partially preserved. Thus, it seems more likely to be talking about body adaptation rather than the involution.

As for the spirit, the earthen laws seem inadequate for it, because the structure of the spirit is different, and assumed to be eternal. In case it's degrading and gives up on the intended mission, it loses self, and is brought back to the spiritual realm as a simple spiritual seed or fraction. Later on, it will be 'seeded' into the Secondary creation and won't ever know that it had formerly been an essence or had an identity. Hence, the growth of the brain can't be a propulsion to the evolution of Man for two reasons. First, grey matter and the brain overall extends due to regular mental efforts, increased immediate recall and permanent mental workouts; and second, the brain (both grey and white matter) orchestrates the processes going on within the body being not a thinking organ, but rather a transmitter

(converter) of the information flowing between the spirit and body.

Such a fine match of human and ape genomes seems natural, because those are the human bodies of the present and the long-ago. The remaining 1% is for their mutation due to a changed lifestyle, which is frequently detrimental to health and aging process. A search for DNA regions responsible for developing a large-sized brain is futile because the genome transmittance of hereditary information is undertaken not by the brain size, but the brain structure while the volume thereof is a product of mental efforts and everyday trainings.

3.9. What the Science Says?

It's been overwhelmed by problems the humankind can't address. Credibility of scientific knowledge is one of those problems. It is deemed credible and authoritative if it has been confirmed by a robust set of independent sources and results. However, we can see that the most prominent scientific concepts have been left unprovable. They are taken for the hypothetical truth, which adds much subjectivity to the science. Therefore, the notion of scientific significance becomes erased when labeling the science a pivotal and regulatory method of cognition.

Thus, no universal concept to justify the truth is yet available, because it must consider both objective reality of things, and our own inner attitudes concerning other realms. Hence, it seems doubtful whether it's possible to scientifically justify the truth of our universe varnished by common conventions.

It enables active (or sometimes even aggressive) battle with things that are not compliant with the materialistic approach to our existence. The idealistic approach has been dubbed as

pseudoscientific and quack preventing ‘legitimate’ discussions of subtle worlds where we (with our spirit) shall appear and continue to progress. So our evolution becomes more restricted and we get dumber making our own future misleading.

Scientific materialism has become a loser, which can no longer succeed at anything except for humanity-destroying technologies and developing more temptations. Difficulties in the materialistic cognition of self and the environment is more hampered by the fact that the human body is limited by five sense organs, and everything that outstep them, is not captured. Therefore, researchers tend to ‘narrow’ their views of processes going around focusing the public on a “truncated” material world discarding philosophical and religious concepts about the “superior” realms. As a result, we can see improving efficiency of machines, devices and technologies, which can be explanatory to the omnipresence of science in the raw materialism, which can lead to more consumerism and allurements.

Neither the science, nor other doctrines have failed to draw us closer to our understanding of the purpose of our life. Moreover, looks like social institutions are not really bothered by this state of affairs favoring temptations, which they think are necessary for the humanity to indulge. Hence, the science seems to be losing self-sufficiency, and can no longer be unequivocal in its judgments. Humanity needs other methods to approach the science to make it more exquisite for not the material body alone, but moral and social values. The policy of all-permissiveness, ostentatious wellness and consumerism has pierced through our minds leaving no worthy option.

Alexander Belyakov (the Moscow Turin Shroud Center) thinks that the so-called ‘scientific’ belief system is taking

shape within the science. It's based on minimalism rested on a baseline assumption that the matter is the only thing behind all those mathematical constructions used by theoreticians when describing an object. As simple as that! Looks like the science needs no God hypothesis!

The notion of materialism is vague and ambiguous. Everyone can bring their own sense in it, and few know that the core of materialism is similar to that of a religion because it's based on faith. It has its prophets, teachers, holy men, doctrines, relics, and heresies. However, belief in the matter as the absolute source of existence kills moral reason to live.

The crude matter is not about spiritual encouragement, because the matter defies spirit. It is about propagation and conservation of species. As for the spiritual realm, it is different and absent in the material domain. The only thing that's left for an integrated human essence is a contact through the astral energy. The idealistic path of evolution suggests the eternal life of Self represented by the spirit of the human being, and denied by materialism.

What would the world looked like if it operated exclusively by material laws? Human mind would be unrequired and replaced by reflexes, instincts, and astral cognition of higher animals. What about the mind? It's somewhere else... not here. We may find it above the astral energy. The spirit is free from Earthen squabbles, because it is here to learn the material life urging its mental sheaths packed with knowledge to do good (moral) deeds.

So these two opposed (spiritual and material) worlds collide, and the spirit is trying to feel them in the struggle and unity of opposites risking itself to fall into deception of

Earthen allurements and die. Two options are available here: understanding of the essence of things, and unusual, unfamiliar, and sometimes voluptuous feelings perceived by the body and therefore shared with the spirit. Those are two forces. The mind on the one hand, and the sense organs (instincts) on the other. It's a hard game for the spirit to play, never mind to win it. The road to Lord is narrow!

Despite being attractive, the body is yet imperfect and temporary. With age, it becomes a hindrance for the spirit to evolve. Therefore, a long-living body turns good into evil. The spirit and its subtle energy sheaths have opt for a new vehicle for the Self throwing off the old material body and keep its subtle ethereal sheath. If the spirit is underdeveloped and can't go up to mental energies, it incarnates into a new body to go on with its evolution in the material context of the earth.

3.10. Entropy

It is a Greek word denoting 'turning toward' or 'transformation'. Generally, entropy is closely linked with a measure of chaos, uncertainty and disorder in a system. The word can be used to characterize and explain almost every process in human life including physical, chemical, and social factors.

One of the postulates of thermodynamics about the equilibrium declares that ***any isolated thermodynamic system gets into the equilibrium with time and can't get out of it on its own.*** It means that every system is prone to the stationary state. Randomness, if put it simply. Entropy determines a measure of disorder consistent with a number of variants for this state to be actualized. The more variants there are, the greater entropy is. The more organized a matter is, the lower its ambiguity (randomness) becomes.

This notion has been accepted by the materialistic science, and it reflects to some degree the processes going on in the Universe since the principles of structure and function of multi-layered energies in all the realms are similar. Still, we face basic differences when trying to analyze the Universe overall.

Entropy might be considered as one of many manifestations of the ***Unity and struggle of opposites***. It divulges major principles of functioning with the Universe being an integral whole having many energy layers creating realms that are individual by their purpose and antagonistic to both one another and the construction in general. This principle of interrelations exists within all the processes whether they are local, simple, complicated, superficial or pivotal.

Their diversity, including the structure of a mundane human, is determined by the amount of rest (order) and chaos (disorder). We exist and change due to the unity and struggle of these opposites. A decisive victory of either opposite is impossible, as it will put the whole system or any of the components to death.

Putting all these processes in order would help to smooth it all out and eliminate acute situations that might lead to a slow transition to a standstill point. Differences between the opposites would start to erase putting the system to the risk of destruction. This might trigger a rebel against the standstill letting chaos act full exacerbating the struggle between the opposites, propelling creative pursuits for better forms of structural and social interrelations. It would return with a drive for rearrangement for the sake of stability of the whole. And so on ad infinitum.

The underling mechanism is unknown, but we it over and over trying to understand the reasons for why a share of microbial colony sacrifices themselves to save the whole colony, i.e.

showing altruism. Alternatively, let's take a constant ratio of 1:3 we see in idealists and materialists. When dealing with that, the physical science tends to approve the logic of fundamental particles observed in their experimental studies. When it comes to bacteria, it very much looks like reason, too. It's a mere illusion! It's nothing but a general law similar to that of entropy.

There is a good chance that this latent factor can be found inside the superior (higher-level) energy. Spiritual and esoteric sources say that inferior (lower-level) energies exist and function due to an incentive given by the superior energies originated from "the Word". Therefore, the lower-level energies can exist in their own right. The winding down of the Universe might be due to this. We know little about specifics and capacities of those energies so far.

The law of the unity and struggle of opposites can be noticed in the social life patterns. Statesmanship and social communities are invariably moving from prosperity to a halt. 'Shaking up' of crystallized regimens might be the only thing that could lead to new and progressive social interrelations. Such processes are not simultaneous globally allowing the civilization to stay.

The serene life is achieved when all the systems are properly arranged, but human vices can always creep into the progress of the events caused by idle mind with the repletion being an early sign of chaos and death. In this regard, the shift in gender roles opposed to God's laws and nature will be ultimately rinsed off like dirty foam. We have no other way! Those manifesting the idea of gender chaos should be aware it will bring nothing but impaired spiritual growth.

Entropy is not an isolated phenomenon of raw (Earthen) materiality, but a speculum of the key law of the Universe, which

is the unity and struggle of opposites. Considering the God-given free will, it allows creating controlled chaos promoting maturation of human Spirit and Self in the long run.

3.11. Conclusions

The Torah suggests that the evil and selfishness are more natural for humanity than good and selfishness. This view is valid since the earthen human stays in the settings of raw materialism as the integrated human essence. The cornerstones here are pragmatism and selfishness which aren't considered evil here on earth being the pith and marrow of Earthen realms. It means evil towards the spirit and the soul not materialistic by nature, but rather subtle and thin. It means that it can be assumed as 'normal' for the body while it's nothing but ill for the spirit and can't help but be treated as evil.

Children are not born selfish, even if they had been so in their previous lives, because their experience including Self have been blocked whereas the intuition has been left for them to help living this life virtually from scratch. However, the rapid development of the body and its sense organs is accompanied by the incorporation of astral (emotional) energy into a process of cognition of the environment and its pragmatic aspects in the first place. Only after that, the environment impels one to embrace the notions of good, love, sacrifice, etc. Therefore, parents shall instill those qualities in their children from a tender age trying to cultivate beneficence and love for other people; otherwise, they risk to be raised on the street resulting in a vision more pragmatically askew of life. Take care!

A sermon about moral challenges won't probably be enough now. New methods to work with the society are needed. The

role of religion in shaping humanity can't be overestimated. The term 'religion' means 'communication with the invisible world'. "Re-" means 'repeat' and 'ligature' are related to Latin 'ligare', which means 'link'. We have a 'repeated link' that has been given to us for salvation.

It was not until the 20th century that we began to realize we had no clue about what the Universe is like. Baryonic matter we are made of accounts for only 4% of the entire Universe, with 1% out of 4% that emits an eye-visible light. The dark matter accounts for about 26 % while the dark energy amounts to 70 %. Based on the above-mentioned, one can question the credibility of many materialistic investigational data because we can't see the most of the Universe.

The presence and the mission of the spirit can't be fully felt with materialistic methods and with their 1% of analysis. Moreover, religion is boundless to navigate in. We strive for extraterrestrial colonization but have no idea that the scientific materialism has entered a deadlock state pushing humanity to degradation due to misinterpretation of the fundamentals. At the same time, religion keeps on holding onto its canons assigning issues not fully understood to sacraments.

Of course, sacraments are not to be opposed, since most of the processes going on in the Universe will forever be kept out of sight. Still, have our mind and free will to use them to nurture our spirit and level it to the top of the Primary creation. To realize the mission, one should remember that the spirit is the key player in our Earthen life; material bodies have been built just for it and all designs are intended for it to grow, acquire experience in the Secondary creation, and, probably, retrieve and retain the quintessence of love elixir taken from the astral energy.

Intolerance to new thinking and behavioristic patterns occasionally seen on the part of adepts of materialism, and those supporting the idealistic approach is a major obstacle resulting from dogmas that have been valid for centuries. Those trying to denigrate users of the idealistic approach to learn life must bethink themselves and stop stigmatizing it as false and macabre; while those obsessed with dogmas shall look through a broader lens considering that some of them are quite murky. For instance, the Fifth Ecumenical Council didn't abrogate the law of Karma, and the law of reincarnation was not pronounced heretical. Still, karma and reincarnation are dubbed as sinful by Christian preachers.

Materialistic and idealistic approaches to the evolution of the earthen man are not to be ignored, since they did everything they could for the human development. We've hit the bottom and reached the point of no return. New methods are needed, since the old-fashioned have led us to nowhere. Salvation of the world will be associated with new insights on our essence and life path resulting in recovered reason and humanness.

British researchers suggest that less than half of British people believe in God while 75% aged 18 to 24 call themselves 'unreligious'. Successful Irish abortion referendum has caused a stir and gained approval among mass media globally. Journalists reported about a brand new step for Europeans made from their conventional religion, as the Catholic Church had been a key player opposing abortions. If the majority favor abortions, it means that the church has lost much of its previous authority.

The New-York Times informed that some of Italian congregations least visited are closing down. In Austria, 660 congregations have been amalgamated into 150. Luxembourg

has abolished religious teachings in schools to separate state and church. About 20% of Spanish Catholics visit masses, while French regulars account for only about 10%. Donations for church have dropped significantly in Germany. Even in Brazil, a highly Catholic country, a fair share of church regulars are becoming atheistic, while others join Evangelical congregations taking more liberal and simple attitudes.

In response to the decline of faith throughout Europe, the Pope has become more focused on the third world countries including African, South American, and Southeastern Asian where people are still quite religious. He pleads priests to participate more in the lives of poor offering help and protection from tyranny.

However, this challenge raises awareness for some other aspects. Over the course of 20 years, the Netherlands have witnessed a decline of academic performance in children including reading, math, and scientific disciplines. The number of children hardly able to read has almost doubled. The UK has been experiencing shortage of qualified personnel, since 9 million can't read and write well.

Young people are opting for qualifications requiring neither brain strain, nor knowledge - stylists, makeup artists, hairdressers, merchants, insurers to name a few. Positions of engineers, scientists, builders, and others needing headwork and responsibility remain vacant and it's getting exacerbated globally.

Depleted mind is in synch with the consumer culture. It's no longer individual but rather a government-supported ideology of prosperous countries. Advertising industry urges people to buy superfluous things. One should be particularly open-eyed with the food and medicine industries. Health is set at naught, but flashy ads seems so persuasive in their 'honesty' and goods quality.

People get relaxed and blind to lofty matters including religion. All you need is consumption, satisfaction and allurements. For adrenaline buzz, people start indulging in perversions violating the laws of nature. It's a climax of decay, since humans get opposed to the Lord stating that the world as it is is imperfect and needs redesigning.

Homosexual Manifesto issued by Gay Community News in February 1987 by Michael Swift can serve a good example. Provisions of the manifesto are a no-brainer. The aggressiveness of the last paragraph, however, is daunting and needs to be cited: "We shall be victorious because we are fueled with the ferocious bitterness of the oppressed who have been forced to play seemingly bit parts in your dumb, heterosexual shows throughout the ages. We too are capable of firing guns and manning the barricades of the ultimate revolution". "Tremble, hetero swine, when we appear before you without our masks".

Much to our regret, homosexuality is neither medical condition, nor physiological deviation, nor genetic defect of human system, but rather a mindset that have been gradually forced upon our society. The sheer fact that much of the stated in the provisions has been put to life is disturbing, and it's no problem to figure out what's next.

At the dawn of the civilization, when a Man was weak and fragile, he would be ready to believe in anything as long as it helped to survive. Psychic powers had by some of them gave rise to rudimental religions that would promote self-comprehension providing options to change one's life. However, technological advances demonstrated that human beings can change their lives using knowledge and efforts, reducing expenditures for social product development and making wishes a true reality. This

avored depletion of the mind made a concept suggesting that welfare and happiness are equal to technological progress.

It has been a betrayal of faith in God, since the body can now have anything without needing Him. Religion has been left behind in prosperous countries due to a rapid growth of technologies triggering temptations for the earthen man and making them ignorant of the fundamentals of life. Most of those people no longer believe they have a soul to save.

The role of astral energy is hard to overestimate, since it is key for the process of cognition activating human mental energies. Considering that it constitutes a mechanism of sensual appraisal of everything around, parameters of how it's manifested on earth are between the strongest evil to the affection most sophisticated that have ever been. If the raw evil is acceptable within the earthen realms, sensual energies of love are required at all layers of the Universe, and the higher they are, the more subtle energies can be used.

Love for the Lord and people without sentiment will look like a duty and necessity making it dry and dull. Address or prayer to God should be filled with feelings because cold praise will bring modest results. Patristic literature suggests that a truly sentimental prayer can cause an 'effulgence' of the icon, levitation and common uplift. It is promoted by a colorful ceremonialism of ecclesiastic ministrations and chanting. Being part of the service generates light and bright energy forms born within our subtle energy sheaths.

Given that characteristic inherent to astral energy, it seems fair that separation of astral energy and exporting its purest fraction to the spiritual realm represents one of implications for the growth of the spirit in the earthen realm.

P.S!

Question: Can we go back to humanness and reason?

— It's possible with the reason, but as for humanness, things look much more complicated. We must understand who we are and what is our mission on earth; leave out heavy-handed pretensions between countries and stop bringing our rules on others. The more we cling to pragmatic attitudes and selfishness, the harder will be the consequences, including the ruin of the civilization.

So what's on our hands?

'Earthen' knowledge is primarily focused on Earthen problems resulting in pragmatic and selfish attitudes. They must not be abnegated, since we shape our mind for getting closer to mental energies using them. With no reason fully developed, a goldmine of mental knowledge won't be requested for further development.

Idealistic outlook stems from the knowledge about the structure and function of the Universe confirmed by religions. They contribute to a more sentimental perception of our life, i.e. spirituality.

Everything going on in the Universe, including earth is interdependent, paramount and gradual. One must not cling to anything whichever they might seem appealing and important, but rather aspire for spiritual evolution preventing pragmatic and selfish attitudes. From that moment on, a threat of wreck will start to fade away.
